Remarks:

<VN03 ... This module is used in sets with production codes VN01 and VN02. Please see the type plate of the set for the production code.

>VN02 ... This module is used in sets with production code VN03 and higher.

E1 ... Digital Board Chrysalis Version Euro 1 for sets with DV input E2 ... Digital Board Chrysalis Version Euro 2 for sets without DV input

AL E1/PS ... Analog Board version A-Lead Euro 1, used from production start onwards.

AL E2/PS ... Analog Board version A-Lead Euro 2 for UK, used from Production Start onwards.

The Analog Board versions "AL Ex/PS" are based on the PWB layout code 3103 603 3033.

This layout code can also be seen on the underside of the Analog Board in the copper near the power supply part.

Analog Board version A-Lead Euro 1 replaces "AL E1/PS" at a certain production date. AL E1 ...

Analog Board version A-Lead Euro 2 for UK replaces "AL E2/PS" at a certain production date.

The Analog Board versions "AL Ex" are based on the PWB layout code 3103 603 3028.

The main difference to the Analog Board used at production start is the used audio digital/analogue converter; see Analog Board circuit

1.2 **Diversity Matrix for sets with drive VAD8031**

Sets with VAD8031 can be identified by the production code starting with VN1A, (then VN1B, VN1C...) and by the presence of a set fan

1.3 General:

1.4

1.4.1

Mains voltage : 198V-276V Mains frequency : 43 Hz - 63Hz Power consumption mains 28 W Power consumption standby : < 7 W

Power consumption low power

stand-by : < 3 W

Test equipment:Fluke 54200 TV Signal generator Test streams:PAL BG Philips Standard test pattern

1.5 **Analogue Inputs**

Tuning Principle

program

operation

1.5.1 SCART 1 (Connected to TV)

PAL B/G, PAL D/K, SECAM L/L', PAL I

1.4.2 RF - Loop Through:

System:

RF Tuner

Frequency range : 45 MHz - 860 MHz Gain: (ANT IN - ANT OUT) : -6 dB to 0dB

1.4.3 Radio Interference:

input voltage /3 tone method (+40

dB min) : no limit

1.4.4 Receiver:

PLL tuning with AFC for optimum reception

: 45.25 MHz - 857 MHz Frequency range: Sensitivity at 40 dB S/N : ≥ 60dB μ V at 75 Ω (video unweighted)

1.4.5 **Video Performance:**

Channel 25 / 503,25 MHz,

Test pattern: PAL BG PHILIPS standard test pattern,

RF Level 74 dBV Measured on SCART 1

: 0 - 4.00 MHz +0-4dB Frequency response: Group delay (0.1~MHz - 4.4~MHz) : $0~\text{nsec} \pm 150\text{nsec}$

1.4.6 Audio Performance:

Audio Performance Analogue - HiFi:

Frequency response at SCART 1

: 100 Hz - 12 kHz / 0± (L+R) output:

3dB

S/N according to DIN 45405, 7, 1967 :

and PHILIPS standard test pattern

FM: \geq 50dB; AM \geq video signal: 45dB, unweighted

Harmonic distortion (1 kHz, \pm 25

kHz deviation): : $FM \le 1.5\%$; $AM \le 2\%$

Audio Performance NICAM:

Frequency response at SCART

1(L+R) output: : $40 \text{ Hz} - 15 \text{ kHz} 0 \pm$ 3dB

S/N according to DIN 45405, 7, 1967 :

and PHILIPS standard test pattern

video signal: ≥ 60 dB unweighted

Harmonic distortion (1 kHz): : ≤ 0.5 %

1.4.7 Tuning

Automatic Search Tuning

scanning time without antenna : typ. 3 min. PAL stop level (vision carrier) $\geq 37dB\mu V$

1.13 PCB Locations

TR 06002_001 300103

Remarks:

The EPG Board and the In/Out Extension Board IOE are only used in the DVDR80.

The DVIO Board is only present in the DVDR75 and only in combination with the Digital Board 1.5 (Empress). It is not present in DVDR75 with Digital Board 2.1 (Chrysalis).

Safety Information, General Notes

2.1 **Safety Instructions**

2.1.1 **General Safety**

Safety regulations require that during a repair:

- Connect the unit to the mains via an isolation transformer.
- Replace safety components, indicated by the symbol **A**, only by components identical to the original ones. Any other component substitution (other than original type) may increase risk of fire or electrical shock hazard.

Safety regulations require that after a repair, you must return the unit in its original condition. Pay, in particular, attention to the following points:

- Route the wires/cables correctly, and fix them with the mounted cable clamps.
- Check the insulation of the mains lead for external damage.
- Check the electrical DC resistance between the mains plug and the secondary side:
 - 1. Unplug the mains cord, and connect a wire between the two pins of the mains plug.
 - 2. Set the mains switch to the 'on' position (keep the mains cord unplugged!).
 - 3. Measure the resistance value between the mains plug and the front panel, controls, and chassis bottom.
 - 4. Repair or correct unit when the resistance measurement is less than 1 M Ω .
 - 5. Verify this, before you return the unit to the customer/ user (ref. UL-standard no. 1492).
 - 6. Switch the unit 'off', and remove the wire between the two pins of the mains plug.

2.1.2 Laser Safety

This unit employs a laser. Only qualified service personnel may remove the cover, or attempt to service this device (due to possible eye injury).

Laser Device Unit

Type Semiconductor laser

GaAlAs

Wavelength 650 nm (DVD)

780 nm (VCD/CD)

Output Power 20 mW

(DVD+RW writing)

0.8 mW (DVD reading)

0.3 mW

(VCD/CD reading)

Beam divergence 60 degree

Figure 2-1

Note: Use of controls or adjustments or performance of procedure other than those specified herein, may result in hazardous radiation exposure. Avoid direct exposure to beam.

2.2 Warnings

2.2.1 General

All ICs and many other semiconductors are susceptible to electrostatic discharges (ESD, &). Careless handling during repair can reduce life drastically. Make sure that, during repair, you are at the same potential as the mass of the set by a wristband with resistance. Keep components and tools at this same potential.

Available ESD protection equipment:

- Complete kit ESD3 (small tablemat, wristband, connection box, extension cable and earth cable) 4822 310 10671.
- Wristband tester 4822 344 13999.
- Be careful during measurements in the live voltage section. The primary side of the power supply (pos. 1005), including the heatsink, carries live mains voltage when you connect the player to the mains (even when the player is 'off'!). It is possible to touch copper tracks and/or components in this unshielded primary area, when you service the player. Service personnel must take precautions to prevent touching this area or components in this area. A 'lightning stroke' and a stripe-marked printing on the printed wiring board, indicate the primary side of the power supply.
- Never replace modules, or components, while the unit is

2.2.2 Laser

- The use of optical instruments with this product, will increase eve hazard.
- Only qualified service personnel may remove the cover or attempt to service this device, due to possible eye injury.
- Repair handling should take place as much as possible with a disc loaded inside the player.
- Text below is placed inside the unit, on the laser cover shield:

Connecting the DVD recorder

Connecting the DVD recorder

Preparing the remote control for operation

ENGLISH The remote control and its batteries are packed separately in the original DVD recorder packaging. You must install the batteries in the remote control before use - described in the following section.

0

Take the remote control and the enclosed batteries (2 batteries).

Open the battery compartment, insert the batteries as shown and then close the battery compartment.

0

The remote control is now ready to use. Its range is approximately 5 to 10 meters.

'Aim' correctly

eary OOO

Ë In the following sections, you will need the remote control for the first time. Aim the remote control at the DVD recorder and not at the TV set.

Connecting your DVD recorder to the TV

set

The necessary cable connections must be made before you can record or playback TV programmes using your DVD recorder.

Connect the DVD recorder **directly** to your TV set. If there is a video recorder in between the picture quality may be poor. We recommend that you use a scart cable to connect your TV set and DVD recorder.

The scart or Euro AV cable serves as the universal connector for picture, sound and control signals. With this type of connection, there is practically no loss of quality in picture or sound transmission. What is a scart cable?

When you install your DVD recorder for the first time, select one of the following options:

your TV set is equipped with Easy Link, Ginema Link, NexTView Link, Q-Link, Smart Link Connecting with a scart cable and Easy Link'

1egalogic, Datalogic, ...' and you wish to use a scart cable.

'Connecting with a scart cable without Easy Link'
If your TV set is not equipped with Tasy Link, Ginema Link, NexTView Link, Q-Link, Smart Link,
Megalogic, Datalogic, ...' and you wish to use a scart cable.

Connecting with an S-Video(Y/C) cable

your TV set is equipped with an S-Video (SVHS) socket.

Connecting with video(CVBS) cable
If your TV set is equipped only with an video(CVBS) socket.

Connecting with a scart cable and Easy Link

Your DVD recorder can exchange information with your TV set using Easy Link. Your TV channels can also be transferred in the same order from your TV set to your DVD recorder using 'Easy Link'. Please see your TV's operating instructions.

Have the following cables ready: an aerial cable (1, supplied), a mains cable (2, supplied), a special scart cable (3, suitable for Easylink).

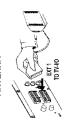

Switch off your TV set.

Remove the aerial cable plug from your TV set. Insert it into the ANTENNA IN socket at the back of the DVD recorder. 0

0

Insert one end of the supplied aerial cable into the TV OUT socket at the back of the DVD recorder and the other end into the aerial input socket at the back of the TV set.

Plug in a special scart cable (for Easylink) into the scart socket EXT 1 TO TVI/IO at the back of the DVD recorder and the corresponding scart socket at the back of the TV set (see TV set operating instructions). 0

Connecting the DVD recorder 2

Insert one end of the supplied aerial cable into the $\,$ TV OUT socket at the back of the DVD recorder and the other end into the aerial input socket at the back of the TV set.

Then, read the paragraph on 'Initial installation' in 'Installing your DVD recorder'

Connecting additional devices

Connecting additional devices to the second scart socket

You can connect additional devices such as decoders, satellite receivers, camcorders, etc to the EXT 2 AUXI-10 socket When playback is started on this additional device the DVD recorder automatically connects the EXT 2 AUXI-10 scart socket with the EXT 1 TO TVI-10 scart socket. You will then see the picture from the additional device on your TV set, even if the DVD recorder is switched off.

The TVI/DVD button on the remote control allows you to switch between playback through the EXT 2 AUXI-10 scart socket and playback from the DVD recorder.

IN COL

ЕИСГІЗН

Connecting additional video recorders

You can connect a video recorder to the EXT 2 AUX-I/O socket.
If you have an SYH5 video recorder you can also use the OUT S-VIDEO (Y/C) socket and the OUT L AUDIO R sockets.

Please note:

Most prerecorded video cassettes and DVDs are copy-protected. If you try to copy them you Most prerecorded video cassettes and DVDs are copy-protected. If you try to copy them you will be a second or copy that you have been provided to the copy of the copy that you have been provided to the copy of the copy that you have been provided to the copy of will see the message 'LBP' PRBT' on the DVD recorder's display.

*When copying video cassettes the display on the DVD recorder shows '센 되죠지만'

If a recording is made from a video recorder, change the tracking on the Check that the cable is plugged in firmly.

The DVD recorder may not be able to recognise the video input signal if

this signal is poor or does not comply with relevant standards.

*When I copy DVD video discs or prerecorded video cassettes the

pricture is fuzzy and the brightness varies
This happens if you try to copy DVDs or video cassettes that have been copy-protected. Even though the picture on the TV is fine the recording on a DVD+R(W) is faulty. This interference is unavoidable with copy-protected Problem

<u>∞</u>

Connecting additional devices

Connect camcorder to the front sockets

To copy camcorder recordings, you can use the front sockets. These sockets are located behind the flap on the left hand side.

Best picture quality

ЕИСТІЗН If you have a DV or Digital 8 camcorder, connect the DV IN input of the DVD recorder to the appropriate DV output on the camcorder.

When films are transferred the original recording date and time are stored as DVD subtides. On playback, this data can be displayed on the TV screen by using the \square , function (Subtitle).

Very good picture quality

If you have a Hi8 or S-VHS(C) cancorder, connect the S-VIDEO input of the DVD recorder to the appropriate S-VHS output on the cancorder.

You must also connect the audio input left AUDIO right on the DVD recorder to the audio

Good picture quality

If you have a camcorder that only has a single video output (Composite Video, CVBS), connect the VIDEO input on the DVD recorder to the appropriate output on the camcorder. You must also connect the audio input left AUDIO right on the DVD recorder to the audio

output on the camcorder.

When the automatic channel search function is activated, the TV channels are stored in a specific order. This may differ from the order in which the TV channels appear on your TV set. This function charges the order of the TV channels stored in your DVD recorder to match the order on the TV set. This only works if the DVD recorder (EXT 1 TO TV4/IO socket) and the TV set are connected with a scart cable.

ارية المغيال

What does EasyLink do?
If your TV set supports Easylink..., TV channels will be stored during initial installation in the same order as they appear on the TV set. To store the TV channels in a different order, you'll need to change the order on the TV set. When you start the Follow TV function the information is transferred again from the TV set.

Switch on the TV set. If required, select the programme number for the DVD recorder. 0

General

Use 'Programming a recording (TIMER)', to automatically start and stop a recording at a later

The DVD recorder will switch to the right programme number and begin recording at the

correct time. With this DVD recorder, you can pre-programme up to six recordings within a period of one

To make a programmed recording, your DVD recorder needs to know

- * the date you want to make the recording the programme number of the TV channel the start and stop time of the recording
- * the recording mode ('M1/M2/M2x/M3/M4/M6') * VPS or PDC on or off

This information is saved in a 'TIMER block'.

What is 'VPS/PDC?

VPS (Video Programming System)/PDC (Programme Delivery Control) are used to control the start and duration of TV channel recordings. If a TV programme starts earlier or ends later than was scheduled, the DVD recorder will then turn on and off at the correct time.

What do I need to know about 'VPS/PDC'?

Usually the start time is the same as the VPS or PDC time. If a different VPS/PDC time is inclicated, eg.; 20.15 (VPS/PDC 20.14); the VPS/PDC time 20.14 must be entered exactly to the minute during programming.
 If you want to programme a time that is different from the VPS or PDC time, you must switch off VPS or PDC.

Only one TV program of a TV channel can be controlled using VPS/PDC at a time. If you want to record two or more TV programmes on a TV channel using VPS/PDC, you will need to programme these as two separate

Since the DVD recorder requires a certain lead time (for getting the disc up to speed and positioning the laser) before recording can start, it is possible that the recorder will miss the first few seconds of a TV show recorded with VPS/PDC. In this case, disable VPS/PDC and enter a start time one minute earlier.

Error message: 'Insert recordable disc'	relither a disc has not been inserted or the disc cannot be used for recording, Insert a disc on which recordings can be made. Switch off the DVD recorder using STANDBY \circlearrowleft .
The error message 'Disc locked' appears briefly on the screen.	\(\int \) write-protected disc has been inserted. Undo the write protection (see 'Preventing accidental erasing of discs' in 'Manual recording') or insert a different disc.
Error message: 'Memory full'	✓If this error message appears after pressing TIMER, then all TIMER blocks are already programmed. No more recordings can be programmed. Press the ▶ button. If you want to clear or check a programmed recording (TIMER block), select it with CH+▲ or CH-▼.
The 'Data error' message appears on the screen.	The data for the recording could not be transferred. Please check date, start time and end time of the programmed recording.
The 'Collision' message appears on the screen.	✓Two programmed recordings overlap. ✓If you ignore this error message the show with the earlier start time will be recorded first. The start of the second show will not be recorded. ✓Change the setting for either of the two recordings. ✓Change the setting for either of the two recordings.

In this section you will learn how to set your user preferences on the DVD recorder. The symbols have the following meanings:

Picture setting	Sound setting	Language setting	Additional settings	Remote control settings	Disc settings	Recording settings	Installation
•	¥		Ð	=	Ð	•	•

ЕИСПІЗН

- Switch on the TV set. If required, select the programme number for the DVD recorder.
- Press SYSTEM-MENU on the remote control. The menu bar Select '¶'A' using ◀ or ▶ and confirm with CH-▼. 0 0
- Select the appropriate function with $\text{CH-} \, \Psi$ or $\, \text{CH+} \, \Delta \,$ and confirm with $\, \Psi \,$. 9
 - Select the appropriate line using $\mathsf{CH}\boldsymbol{\cdot} \blacktriangledown$ or $\mathsf{CH}\boldsymbol{\cdot} \blacktriangle$ and confirm with \blacktriangledown . 0
- Select the appropriate function using $\mathbf{CH} \boldsymbol{\cdot} \blacktriangledown \mathbf{V}$ or $\mathbf{CH} \boldsymbol{\cdot} \blacktriangle$ or the setting with \blacktriangledown or \blacktriangleright . 0
- Confirm the new setting by pressing **OK**.
- To close the menu item, press \blacktriangleleft .

Picture settings

You can choose the following features in this menu:

'TV shape'

The picture signal from your DVD Recorder can be set to match your TV screen. 4.3 letterbox: for a wide-screen picture with black bars at the top and bottom 4.3 panscan? for a full-height picture with the sides trimmed.
16.9': for a wide-screen TV set (screen edge ratio 16.9)

Black level shift

Adapts the colour dynamics for NTSC playback

Vertical video shiff

Use this feature to adjust the position of the picture on your TV left or right using ◀, ▶ to suit your TV set.

SCART video'

By default the recorder is set to 'RGB'. Select 'S-Video' if you want to connect an S-VHS

ЕИСГІЗН

Sound settings

Depending on which audio outputs are used you can select the settings in this menu. If you only use the analogue audio output ($\mathbf{OUTLAUDIOR}$), select the settings ' \mathbf{OH} ' in the 'Digital output' menu.

'Digital output'

9 MB (C) ,30 3

For devices connected to the DIGITAL AUDIO OUT socket, you can select from the following

'AII: Dolby Digital and DTS signals are fied unaltered to the digital output. MPEG-2 multi-channel signals are converted to PCHY fluise Code Modulation).

For received-radiation profilers with digital multi-channel sound decoders.

PCM only: Dolby Digital and MPEG-2 multi-channel signals are converted to PCM (Pulse Code

For receivers/amplifiers without digital multi-channel sound decoders.

Digital output switched off. For devices with analogue audio input.

'Analogue output'

For devices connected to the analogue audio output (OUT LAUDIO R), you can select from the following settings.

'Stereo': For devices without DolbySurround or TruSurround. Use this setting if the DVD recorder is only connected to a stereo TV set. Surround: Dolby Digital and MPEG-2 multi-channel are mixed down to a DOLBY surround-compatible two-channel output signal. For devices with Dolby Surround

Pro Logic decoder.

Night mode'

Night mode optimises the sound for playback at low volume. You are therefore less likely to disturb your neighbours. This only works for Dolby Digital audio on DVD video discs.

Language settings

You can choose the following settings in this menu:

'Audio Language' 'Recording audio' Playback audio language Audio recording

'Menu'

Subtitle language

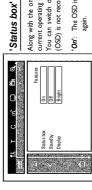

Screen menu language

'Country'

Country

Additional settings

You can select the following functions in this menu:

Along with the on screen menu, the OSD (On Screen Display) also displays information on the current operating status (counter, playback, recording, TV channel, etc.) on the TV screen. You can switch off the information about the operating status so that the on screen display (OSD) is not recorded during copying.

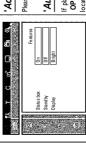

'On': The OSD information appears in every selected mode for a few seconds and disappears

'Off: The OSD information is switched off. It is no longer displayed on the screen.

User preferences

Disk feature menu

In this menu you can make the changes that relate to the disc:

ЕИСПІЗН

To save power, you can switch off the clock display on the DVD recorder. Programmed (TIMER) recordings will still take place.

Standby'

In addition, you can present the most important features of the DVD recorder in scrolling text **Low power**': If the DVD-Recorder is switched off (button **STANDBY** \circlearrowleft), the dock display is

'Access control'

Please read the next chapter on 'Access control (child lock)'.

'Auto resume'

If playback of a pre-recorded DVD video disc or video CD is interrupted (button STOP ■ or OPEN/CLOSE ▲) when the disc is reloaded (disc is started) playback starts at the precise location where it stopped. This applies not only to the current disc but to the bat 20 discs played.

This feature can be switched off if not required.

You can change the brightness of the display on the DVD recorder. This setting only affects the

DVD recorder when it is switched on.

Display

'Bright': The display appear with normal brightness. The disc tray light is switched on.

Dimmed: The display appears less bright. The disc tray light is switched off.

'Off: The display and the disc tray light are switched off.

Remote Control settings

'Demo mode': If the DVD recorder is switched off with the **STANDBY** \circlearrowleft button, a list of the most important features is shown in the display. ${\it Off}$: If the DVD-Recorder is switched off (button STANDBY \circlearrowleft), the clock display is visible.

This line appears only if a VCD is loaded.
This function lets you activate or deactivate the PBC menu (Playback Control) for video CDs. See 'Playing a (Super) Video CD'.

Finalise disc

This feature allows you to finalise DVD+R discs. If the disc has already been finalised this line will appear darker.

'Adapt disc format'

If a DVD+RW has been recorded in a computer drive or in another DVD recorder the index

'DVD player': The DVD recorder responds to a DVD player remote control.

The DVD recorder also responds to the remote control of a DVD player (remote control code RC-6). Choose this setting if your Philips TV remote supports DVD

'DVD recorder': The DVD recorder only responds to the supplied remote control.

In this menu you can set the remote control type to which your DVD recorder should respond.

screen may not be displayed correctly.

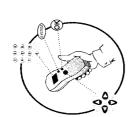

This feature allows you to change the format of the disc.
It is therefore only visible if the disc format is different.

|Access control (Child Lock)

Child lock (DVD and VCD)

When Child Lodk is on, a 4-digit code (PIN) needs to be entered before a disc can be played. You can also decide whether the inserted disc should always be played or should be played only This feature enables discs to be locked for children. once, despite the child lock

ЕИСГІЗН This disc is stored in a memory with space for 50 child-safe discs. If more than 50 discs are stored, the last disc in the list is removed and the new disc is added. The screen shows 'Child sale' at the start of playback.

·)'Play once:

This disc is only authorised for single playback. If the recorder is switched off, the PIN code must be re-entered.

Activating/deactivating child lock

- Switch on the TV set. If required, select the programme number for the DVD recorder. 0
 - Switch on the DVD recorder using STANDBY/ON & 0
- Press SYSTEM-MENU. The menu bar appears
- 0 9
- Select ' $\textcircled{O}(Disc\ features)$ ' using CH- \blacktriangledown or CH+ \blacktriangle and confirm with \blacktriangledown . 0
- Confirm 'Access control using ▶. 0
- Enter a 4-digit code of your choice. If the code is new, you may have to enter the code a second time as confirmation.
- Select 'Child lock' using CH+ ▲ or CH- ▼ and confirm with ▶

0

0

- Select the '⊕' icon using CH- ▼ or CH+ ▲
- Confirm with **OK**.

8

Quit the feature using ◀ and SYSTEM-MENU

Unauthorised discs can only be played by entering the four-digit PIN code. To deactivate the child lock, select the \square icon in \bigodot

Authorising a disc

- Insert a disc. The access control box will appear after a short delay.
- Using CH+ ▲ or CH- ▼ select 'Play once' or 'Play always'.
- Enter your PIN code using the number buttons 0..9.

Double-sided DVDs may have a different ID for each side. For these discs, each side must be authorised. Multi-volume video CDs may have a different ID for each volume. For these CDs, each volume must be authorised.

Locking unlocked discs

To lock a disc that was formerly authorised follow the instructions below

- Insert a disc. Playback starts automatically. If the playback does not start automatically, press ${\bf PLAYP}$
- Press the **STOP** button while the 'with' icon is visible. The icon changes to 'with' The disc is now locked. 0

Parental level control (DVD video only)

Films on pre-recorded DVD discs may contain scenes not suitable for children. Therefore, some discs may contain 'Parental Control' rating information that applies to the entire disc or to

playback the filter value set on the DVD recorder is compared to the scene. If the filter value is higher than the setting, an alternative scene will be played (if available). Most DVDs apply the rating to an entire DVD. Therefore, if certain scenes exceed the rating you select, the entire disc will be blocked from viewing. certain scenes on the disc. The appropriate scenes have filter values that reach from 1-8. If such a scene is detected during

4. Mechanical Instructions

4.1 Dismantling and Assembly of the Set

For item numbers please see the exploded views in chapter 10.

4.1.1 Manually opening the tray

- In case the loader is defective or cannot be opened electrically you can open the tray manually.
- Through a slot at the underside of the cabinet a slider that unlocks the tray can be accessed.
 However in sets with drive VAD8031 (AV3) the slot is covered by an adhesive tape on the cabinet of the drive to prevent dust coming into the drive. Push through this adhesive tape by means of a thin screwdriver and move the slider to the left, see picture 4-1.
- Make sure that an adhesive tape has been reapplied to the AV3 drive when repair is finished!

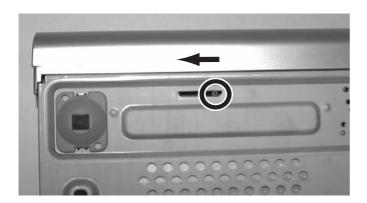

Figure 4-1

4.1.2 Front

- After removing the top cover, remove tray front (1), see picture 4-2
- Remove the three screws (2) that fix the front panel
- Release the two snap hooks on the sides (3)and remove the front (4)
- Remove the 9 screws (5) to remove the front plate (6), see picture 4-3

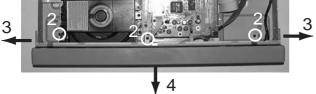

Figure 4-2

Figure 4-3

DVIO Board, only for sets with DV input and Digital Board 1.5

To put the DVIO board in a service position, an extender board must be used. This extender board can be ordered with codenumber 3104 128 07770.

- After removal of the EPG board (if present) the DVIO board can be reached
- Remove the two screws (1), see picture 4-4
- Release the snaps of the two board spacers 125
- Put the DVIO board in the service position with the extender board 3104 128 07770.

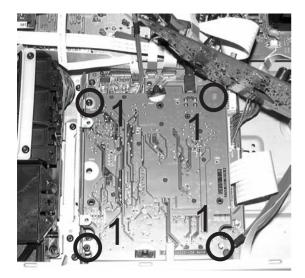

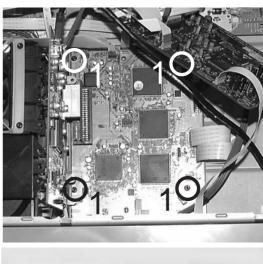

Figure 4-4

4.1.4 Digital Board

- After removal of EPG board (if present) and DVIO board (if present) the digital board can be reached
- Remove screws (1)
- Turn the PCB in the service position

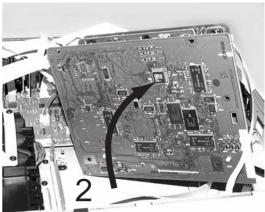

Figure 4-5

4.1.5 Basic Engine

- Remove the tray (1)
- Remove the four screws that fix the drive, see figure 4-6 or 4-7

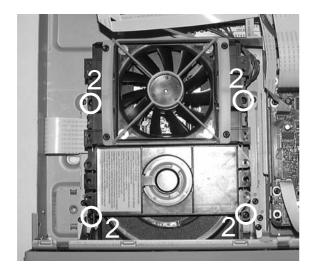

Figure 4-6

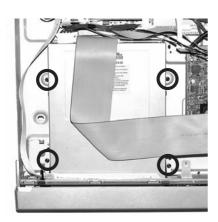

Figure 4-7

4.1.6 Analog Board

- Remove the 3 screws (1) that fix the back plate to the bottom plate, see picture 4-8
- Remove the 4 screws (2) that fix the Analog Board to the bottom plate
- In sets with fan remove the Fan assy by releasing the fixing screw (3)
- Remove screw safety holder (4)
- Unlock the two snaps hooks at the left and right (5), see picture 4-9, and pull the board and backplate out gently (6)
- Turn the PCB in the service position (7), see picture 4-10

5. Diagnostic Software

Due to the complexity of the DVD recorder, the time to find a defect in the recorder can become long. To reduce this time, the recorder has been equipped with Diagnostic and Service software (DS). The DS offers functionality to diagnose the DVDR hardware and tests the following:

- Interconnections between components
- · Accessibility of components
- Functionality of the audio and video paths

This functionality can be accessed via several interfaces:

- 1. End user/Dealer script interface
- 2. Command Interface
- Player script interface for sets with Digital Board 1.5, Empress
- 4. Menu interface for sets with Digital Board 1.5, Empress

5.1 End User/Dealer Script Interface

5.1.1 Description

The End user/Dealer script interface gives a diagnosis on a stand alone DVD recorder. During this mode, a number of hardware tests (nuclei) are automatically executed to check if the recorder is faulty. The diagnosis is simply a "fail" or "pass" message. If the message "FAIL" appears on the display, there is apparently a failure in the recorder. If the message "PASS" appears, the nuclei in this mode have been executed successfully. There can be still a failure in the recorder because the nuclei in this mode don't cover the complete functionality of the recorder.

5.1.2 Structure

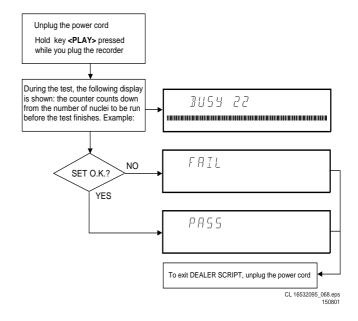

Figure 5-1

The End use/Dealer script executes all diagnostic nuclei that do not need any user interaction and are meaningful on a standalone DVD recorder.

5.1.3 Contents for sets with Digital Board 1.5, Empress

The nuclei called in the End user/Dealer script are the following:

Nucleus	Name	Description
104	HostdSdramWrR	checks all memory locations of the 4MB SDRAM
106	HostdDramWrR	checks all the DRAM connected to the microprocessor of the digital board
123	Hostdl2cNvram	checks the data line (SDA) and the clock line (SCL) of the I2C bus between the host decoder and NVRAM
202	SAA7118l2c	checks the interface between the Host I2C controller and the AVENC SAA7118 Video Input Processor
200	VideoEncl2c	checks the interface between the host I2C controller and Empress SAA6752
207	AudioEncl2c	checks the I2C connection between the host decoder and Empress SAA6752
204	AudioEncAccess	tests the HIO8 interface lines between the host decoder and the audio encoder
203	AudioEncSramAccess	checks the access of the SRAM by the audio encoder (address and data lines).
205	AudioEncSramWrR	tests the SRAM connected to the audio encoder
206	AudioEncInterrupt	tests the interrupt line between the host decoder and the audio encoder
300	VsmAccess	checks whether the VSM interrupt controllers and DRAM are accessible
303	VsmInterrupt	checks both interrupt lines between the VSM and the host decoder
302	VsmSdramWrR	tests the entire SDRAM of the VSM
1400	Clock11_289MHz	switches the A_CLK of the micro clock to 11.2896 MHz
1401	Clock12_288MHz	switches the A_CLK of the micro clock to 12.288 MHz
601	BeS2Bengine	checks the S2B interface with the Basic Engine by sending an echo command
500	DisplayEcho	checks the interface between the host processor and the slave processor on the display board
700	AnalogueEcho	checks the interface between the host processor and the microprocessor on the analogue board
711	AnalogueNvram	checks the NVRAM on the analogue board
706	AnalogueTuner	checks whether the tuner on the analogue board is accessible

5.2 Player Script Interface only for sets with Digital **Board 1.5 Empress**

5.2.1 Description

The Player script will give the opportunity to perform a test that will determine which of the DVD recorder's modules are faulty, to read the error log and to perform an endurance loop test. To successfully perform the tests, the DVD recorder must be connected to a TV set.

To be able to check results of certain nuclei, the player script expects some interaction of the user (i.e. to approve a test picture or a test sound). Some nuclei (e.g. nuclei that test functionality of the DVDR module) require that a DVD+RW disc

Only tests within the scope of the diagnostic software will be executed hence only faults within this scope can be detected.

Structure of the Player Script

The player script consists of a set of nuclei testing the hardware modules in the DVD recorder: the Display PWB, the Digital PWB, the Analogue In/Out PWB and the DVDR module. Nuclei run by the player test need some user interaction; in the next table this interaction is described. The player test is done in two phases:

- Interactive tests: this part of the player test depends strongly on user interaction and input to determine nucleus results and to progress through the full test. Reading the error log information can be useful to determine any errors that occurred recently during normal operation of the DVD
- The loop test will perform the same nuclei as the dealer test, but it will loop through the list of nuclei indefinitely.

STEP	DESCRIPTION	NUCLEUS
1	Press OPEN/CLOSE and PLAY at the same time and POWER ON the recorder to start the playerscript	2
2	The local display shows FPSEGMENTS . Press PLAY to start the test. First the <i>starburst pattern</i> is lit, then the <i>horizontal segments</i> are lit, followed by the <i>vertical segments</i> and the last test is <i>light all segments</i> test. After each of the 4 tests the user has to confirm that the correct pattern was lit. Press PLAY to confirm that the correct pattern was lit (four times if the FPSEGMENTS test was successful). Press RECORD to indicate that the correct pattern was not successfully lit. Press STOP to skip this nucleus.	502

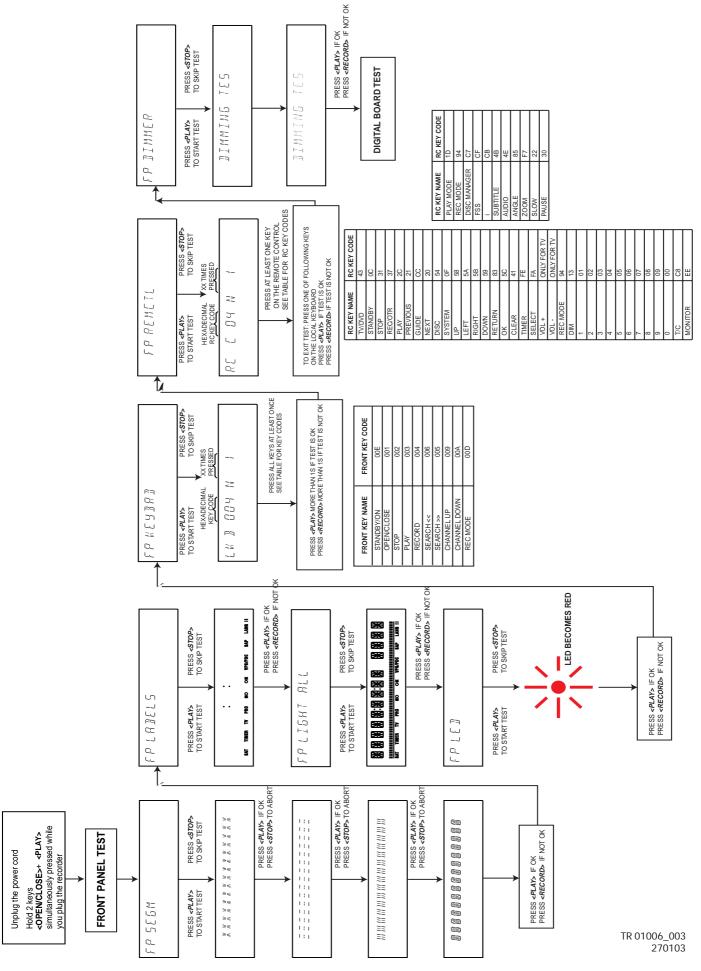

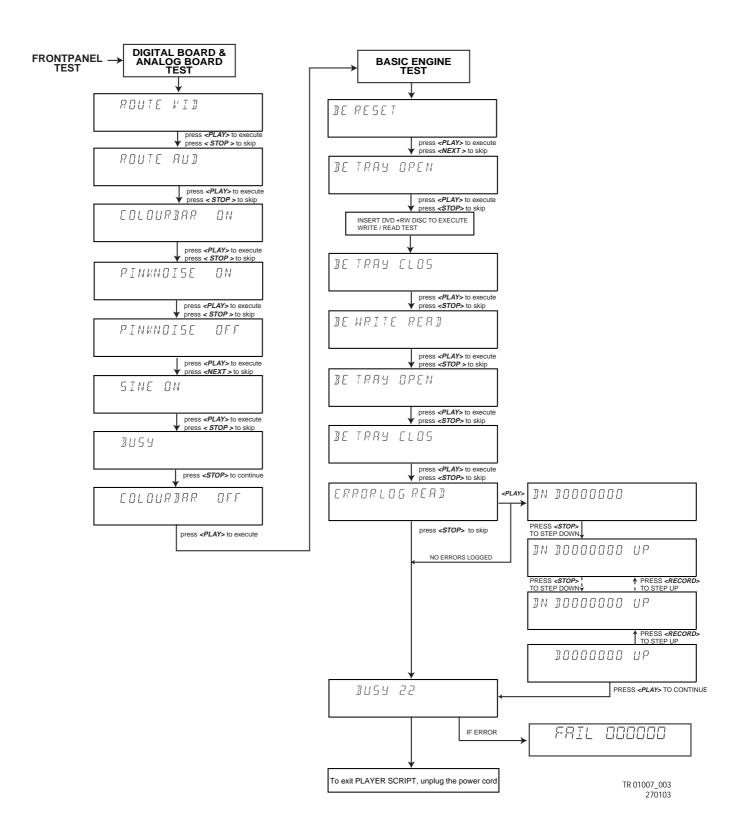

Figure 5-2

Error Log

Explanation:

The application errors will be logged in the NVRAM. The maximum number of error bytes that will be visible is 19. The last reported error is shown as DN D0000000, the oldest visible error as D0000000 UP and the errors in between as DN D0000000 UP. DN stands for DOWN, UP stands for UPWARDS. The shown error codes are identical to the Nuclei Error Codes (paragraph 5.4).

DVDR70 & DVDR75/0x1

5.2.4 **Trade Mode**

TRADE MODE

When the recorder is in Trade Mode, the recorder cannot be controlled by means of the front key buttons, but only by means of the remote control.

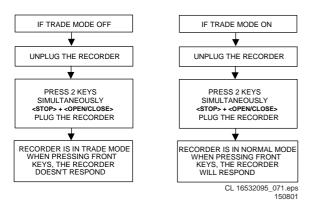

Figure 5-4

5.2.5 Virgin mode

If you want that the recorder starts up in Virgin mode, follow this procedure:

- Unplug the recorder
- plug the recorder again while you keep the STAND BY/ON
- the set starts up in Virgin mode.

5.3 **Menu and Command Mode Interface**

5.3.1 **Nuclei Numeration**

Each nucleus has a unique number of four digits. This number is the input of the command mode.

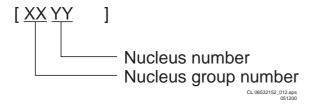

Figure 5-5

The following groups are defined for Digital Board 1.5, Empress:

Group number	Group name
0	Basic / Scripts
1	Host decoder (Sti5505 and memory)
2	Audio / video encoder (DVDR only)
3	VSM (DVDR only)
4	NVRAM
5	Front Panel

Group number	Group name
6	Basic Engine
7	Analogue board (DVDR only)
8	DVIO (DVDR only)
9	Loop nuclei (DVDR only)
10	Library sub nuclei (I2C nuclei)
11	User interface
12	Furore (SACD only)
13	DAC (SACD only)

The following groups are defined for Digital Board Chrysalis:

Group number	Group name
0	Basic / Scripts
1	Chrysalis
2	Boot EEPROM
3	NVRAM
4	SDRAM
5	Flash
6	Video Input Processor
7	DVIO
8	Progressive Scan
9	Basic Engine
10	Display and Control Board
11	Analogue Board
12	System

5.3.2 **Error Handling**

Each nucleus returns an error code. This code contains six numerals, which means:

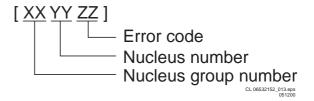

Figure 5-6

The nucleus group numbers and nucleus numbers are the same as above.

5.3.3 **Command Mode Interface**

Set-Up Physical Interface Components

Hardware required:

- Service PC
- one free COM port on the Service PC
- special cable to connect DVD recorder to Service PC

The service PC must have a terminal emulation program (e.g. Hyperterminal) installed and must have a free COM port (e.g. COM1). Activate the terminal emulation program and check that the port settings for the free COM port are: 19200 bps, 8 data bits, no parity, 1 stop bit and no flow control. The free COM port must be connected via a special cable to the RS232 port of the DVD recorder. This special cable will also connect the test pin, which is available on the connector, to ground (i.e. activate test pin).

Code number of PC interface cable: 3122 785 90017

Activation Digital Board 1.5 Empress

Plug the recorder to the mains and the following text will appear on the screen of the terminal (program):

```
DVD Video Recorder Diagnostic Software version 48
Basic SDRAM Data bus test passed
Basic SDRAM Address bus test passed
Basic SDRAM Device test passed

(M) enu, (C) ommand or (S) 2B-interface? [M] : @ C 

DD:>
```

Figure 5-7

The first line indicates that the Diagnostic software has been activated and contains the version number. The next lines are the successful result of the SDRAM interconnection test and the basic SDRAM test. The last line allows the user to choose between the three possible interface forms. If pressing C has made a choice for Command Interface, the prompt ("DD>") will appear. The diagnostic software is now ready to receive commands. The commands that can be given are the numbers of the nuclei.

Activation Digital Board Chrysalis

- Pull the mains cord from the recorder and reconnect it again (reboot).
- 2. The next welcome message will appear on the PC:

Welcome screen D&S program

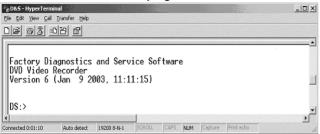

Figure 5-8

Now, the prompt 'DS:>' will appear. The diagnostic software is now ready to receive commands. The commands that can be given are the numbers of the nuclei. If you see above shown screen, continue with paragraph 'Nuclei Codes'.

It is possible that the next messages will appear when starting the DVD+RW for the first time

Error messages D&S program

Figure 5-9a

Error messages D&S program

Figure 5-9b

In these cases, the boot EEPROM of the Chrysalis Digital Board does not contain the required string with the hardware information. To update the Digital Board with the correct string, nucleus 1226 must be executed.

See next section 'Diversity String Input'.
There can also be the next error message.

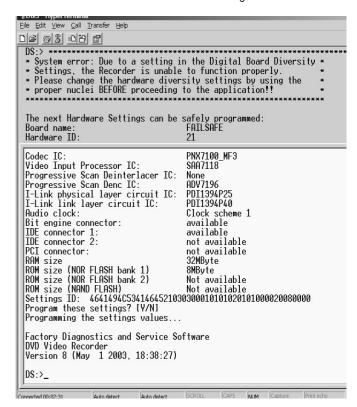

Figure 5-9c

Enter "Y" to program a safe string. With this automatically generated string the board will work in principle but it has to be checked if all board settings were detected correctly.

Diversity String Input

4. Execute nucleus 1226 to enter the string. Please see chapter 8.5 for details

Nucleus 1226 execution with string

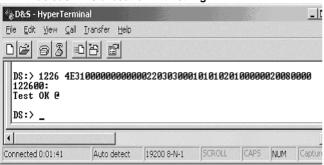

Figure 5-10

5. To check if the hardware info is filled correctly, you can execute nucleus 1228.

Nucleus 1228 info example

Figure 5-11

- 6. Exit the 'Terminal' program.
- 7. Reboot the DVD recorder to allow the software to start.

Command Overview Digital Board 1.5 Empress

We provide an overview of the nuclei and their numbers. This overview is preliminary and subject to modifications.

Host Decoder [01]

[xx yy] Number	Nuclei
100	Checksum Flash

Routing Audio and Video

Route Video

Nucleus Number: 712

Description

This nucleus routes the video signals on the analogue board to the destination determined by the input parameters

The paths that are available for video routing and their description (Euro region):

Path ID	Description
00	Input signal is VIDEO(CVBS) from digital board and will be re-routed back to the digital board.
01	Input signal is from FRONT VIDEO(CVBS) IN and will be routed to the digital board.
02	No Routing.
03	Input signal is from FRONT S-VIDEO(Y/C) and will be routed to the digital board.
04	No Routing.
05	Input signal is CVBS from SCART1 and will be routed to the digital board.
06	Input signal is CVBS from SCART2 and will be routed to the digital board.
07	Input Signal is CVBS from Digital Board and it will be routed to Scart1 and Scart2.
08	Input signal is VIDEO(CVBS) from ANTENNA IN and will be routed to SCART2.
09	Input signal is VIDEO(CVBS) from SCART1 and will be routed to SCART2.
10	Input signal is VIDEO(CVBS) from SCART2 and will be routed to SCART1.
11	Signal path is routed Fast Blank from Scart2 pin16 and will be routed Scart1 pin16
12	Input Signal is YC from Digital Board and it will be routed to Scart1.
13	
14	No Routing.
15	Input Signal is CVBS from TUNER and it will be routed to Digital .
16	No Routing.
17	Input Signal is routed from digital board YC to REAR S-VIDEO(YC) OUT
18	Signal path is routed from digital board RGB to RGB SCART1 and from digital board CVBS to digital board CVBS.
19	No Routing.
20	Input RGB Signal is routed from Digital Board to SCART1(RGB),Input CVBS Signal from Digital Board to Digital Board and Fast Blanking Signal from Scart 2 to Scart1.
21	Input Y/C Signal from Digital Board is routed to Rear Y/C Connector and Input Y/c Signal from Front Y/C connector is routed to Digital Board.

Example

DD:> 712 01

71200: Video routing on the Analogue Board OK.

Test OK @

Route Audio Nucleus Number: 713 Description

This nucleus routes the audio on the analogue board to the destination determined by the input parameters

The paths that are available for audio routing and their

description (Europe version)

Path ID	Description
00	Input signal is from FRONT AUDIO IN and will be routed to the digital board. (This is done so that nucleus 901 works)
01	Input signal is from FRONT AUDIO IN and will be routed to the digital board.
02	No Routing.
03	Input signal is AUDIO from SCART1 and will be routed to the digital board.
04	Input signal is AUDIO from SCART2 and will be routed to the digital board.
05	No routing.
06	No routing.
07	Input Audio signal is from the digital Board and it will be routed to the Scart 1 and Scart2
08	Input AUDIO signal from TUNER and will be routed to SCART2.
09	Input signal is AUDIO from SCART1 and will be routed to SCART2.
10	Input audio signal from Scart2 is routed to Scart1.
11	Input Audio signal is routed from DVIO to Scart2.
12	
13	No Routing.
14	Input is Audio Signal from DVIO and it will be routed to Digital Board.
15	Input is Audio Signal from TUNER and it will be routed to Digital Board
16	No routing.
17	No Routing.
18	Input signal is from FRONT AUDIO IN and will be routed to SCART2.
21	Input signal is from FRONT AUDIO IN and will be routed to the digital board. (This is done so that nucleus 909.1 works)

EXAMPLE DD:> 713 00

Command overview Digital Board Chrysalis

Below you will find an overview of the nuclei, their numbers, and their error codes. This overview is preliminary and subject to modifications.

Chrysalis (CHR)

Nucleus Name	DS_CHR_DevTypeGet
Nucleus Number	100
Description	Sends the device ID and the module ids and revisions of the PNX7100 (Chrysalis) to the stdout port.
User Input	None
Example	DS:> 100 Device ID 7100 Codec ID PNX7100_MF2 F-BCU (0x0102) 1.0 INTC (0x011d) 1.0 PCI-XIO(0x0113) 1.0 SIF(0x013b) 1.0 EJTAG (0x0104) 0.0 S-BCU (0x0102) 1.0 BOOT (0x010a) 1.0 CONFIG (0x013f) 1.0 RESET (0x0123) 1.0 DEBUG (0x0116) 0.0 UARTO (0x0107) 0.1 UART1 (0x0107) 0.1 UART2 (0x0107) 0.1 UART3 (0x0107) 0.1 I2C0 (0x0105) 0.1 I2C1 (0x0105) 0.1 GPIO (0x013c) 1.0 SYNC (0x013a) 1.0 DISP0 (0xa015) 0.1 DISP1 (0xa00f) 0.0 OSD (0x0136) 0.1 SPU (0xa00e) 0.0 MIXER (0x0137) 1.0 DENC (0x0138) 0.1 CCIR (0x0139) 1.0 VDEC (0x0133) 0.1 PARSER (0xa00d) 0.0 DV (0xa00c) 0.0 BEI (0xa00a) 0.0 IDE (0xa009) 0.0 SGDX (0xa008)0.0 BYTE (0xa00b) 0.0 OUTPUT (0xa003) 0.0 ACOMP (0xa000) 0.0 VFE (0xa011) 0.0 VCOMP (0xa002) 0.0 SCR (0x0000) 0.0 SIFF (0xa011) 0.0 WMD (0xa010) 0.0 AUDIOO (0xa015) 0.1 AUDIO1 (0xa00f) 0.0 PSCAN (0xa018) 0.0

DS_CHR_TestImageOn
101
Generates a test-image of a selected video standard on selected video output on the digital
board. When no input is given, the default values will be used. Use nucleus
DS_ANAB_VideoRouting to route the video signal on the analogue board output
The user has to decide which test image, video standard and video output must be used:
Test image id:
0 VERTICAL_COLOURBAR (default)
1 HORIZONTAL_COLOURBAR
2 WHITE
3 YELLOW
4 CYAN
5 GREEN
6 MAGENTA
7 RED
8 BLUE
9 BLACK
10 GRAY
Video standard:
PAL (default)
NTSC
Video output:
ALL CVBS and YC and RGB (default)
CVBS
YC
RGB
YUV
PSCAN progressive scan

Nucleus Name	DS_CHR_SineOn
Nucleus Number	103
Description	Generate an audio sine signal on the audio output of the digital board. Note: Left channel 6kHz, right channel 12 kHz sine. Make sure to route the signal first.
User Input	None
Example	DS:> 103 010300: Test OK @

Nucleus Name	DS_CHR_SineOff
Nucleus Number	104
Description	Stop generating the audio sine signal
User Input	None
Example	DS:> 104 010400: Test OK @

Nucleus Name	DS_CHR_SineBurst
Nucleus Number	105
Description	Generate an audio sine signal on the audio output of the digital board for 4 seconds.
	Note: Left channel 6kHz, right channel 12 kHz sine with some known hick-ups
User Input	None
Example	DS:> 105 010500: Test OK @

Nucleus Name	DS_CHR_MuteOn
Nucleus Number	106
Description	Mute the audio outputs of the digital board
User Input	None
Example	DS:> 106 010600: Test OK @

Nucleus Name	DS_CHR_MuteOff
Nucleus Number	107
Description	De-mute the audio outputs of the digital board
User Input	None
Example	DS:> 107 010700: Test OK @

Nucleus Name	DS_CHR_DvLedOn
Nucleus Number	108
Description	Check the connection to the DV-LED on the digital board by switching it on
User Input	None
Example	DS:> 108 010800: Test OK @

Nucleus Name	DS_CHR_DvLedOff
Nucleus Number	109
Description	Switch off the DV-LED on the digital board
User Input	None

Example	DS:> 109
	010900:
	Test OK @

Nucleus Name	DS_CHR_MacroVisionOn
Nucleus Number	110
Description	Turn on MacroVision.
User Input	None
Example	DS:> 110 011000: Test OK @

Nucleus Name	DS_CHR_MacroVisionOff
Nucleus Number	111
Description	Turn off MacroVision.
User Input	None
Example	DS:> 111 011100: Test OK @

Nucleus Name	DS_CHR_Peek
Nucleus Number	112
Description	Peek a value on a specified address
User Input	The address to peek on
Example	DS:> 112 0xa0700000 011200: Value read = 0x000001BD Test OK @

Nucleus Name	DS_CHR_Poke
Nucleus Number	113
Description	Poke a value on a specified address
User Input	The address to poke and the value: <address><value></value></address>
Example	DS:> 113 0xa0700000 0xaabbccdd 011300: Test OK @

Nucleus Name	DS_CHR_INT_PICInterrupts
Nucleus Number	114
Description	Test all interrupts of the priority interrupt controller
User Input	-
Example	DS:> 114 011400: Test OK @

Nucleus Name	DS_CHR_DMA_TestDMA
Nucleus Number	115
Description	Test the memory to memory DMA transfer
User Input	-
Example	DS:> 115 011500: Test OK @

Boot EEPROM (BROM)

Nucleus Name	DS_BROM_Communication
Nucleus Number	200
Description	Check the communication between the IIC controller of the Chrysalis and the boot EE-PROM
User Input	None
Example	DS:> 200 020000: Test OK @

Nucleus Name	DS_BROM_WriteRead
Nucleus Number	201

Description	Check whether the Boot EEPROM can be written to and read from	
User Input	None	
Example	DS:> 201 020100: Test OK @	

NVRAM

Nucleus Name	DS_NVRAM_Communication
Nucleus Number	300
Description	Check the communication between the IIC controller of the Chrysalis and the EEPROM
User Input	None
Example	DS:> 300 030000: Test OK @

Nucleus Name	DS_NVRAM_WriteRead
Nucleus Number	301
Description	Check whether the EEPROM can be written to and read from
User Input	None
Example	DS:> 301 030100: Test OK @

Nucleus Name	DS_NVRAM_Clear
Nucleus Number	302
Description	Make the EEPROM empty, containing all zeroes.
User Input	None
Example	DS:> 302 030200: Test OK @

Nucleus Name	DS_NVRAM_Modify
Nucleus Number	303
Description	Modifies one or more locations in NVRAM and updates the checksum of the section modified
User Input	The location that must be modified i.e. "ALL" "BOOT" "DIAGNOSTICS" "DOWNLOAD" "CONFIG" "RECORDER" or no string if an offset from the base address of the NVRAM is required The offset and data which to put on the selected location <offset> <length> <data></data></length></offset>
Example	DS:> 303 DIAGNOSTICS 5 1 0x5a 030300: Section is modified successfully Test OK @

Nucleus Name	DS_NVRAM_Read
Nucleus Number	304
Description	Read out one or more locations in the NVRAM
User Input	The location which must be read i.e. "ALL" "BOOT" "DIAGNOSTICS" "DOWN LOAD" "CONFIG" "RECORDER" or no string if an offset from the base address of the NVRAM is required The offset and number of bytes to read <offset> <length></length></offset>
Example	304 DIAGNOSTICS 0 6 030400: Value read = 0x00 0x00 0x00 0x00 0x5A Test OK @

SDRAM

Nucleus Name	DS_SDRAM_WriteRead
Nucleus Number	400
Description	Check all data lines, address lines and memory locations of the SDRAM
User Input	None
Example	DS:> 400 040000: Test OK @

Nucleus Name	DS_SDRAM_WriteReadFast	
Nucleus Number	401	
Description	Check all data lines and address lines of the SDRAM	
User Input	None	
Example	DS:> 401 040100: Test OK @	

Nucleus Name	DS_SDRAM_Write
Nucleus Number	402
Description	Write to a specific memory address
User Input	The location that must be modified (SDRAM starts at address 0xA0000000) The value to put on the selected location
Example	DS:> 402 0xa1000010 0xad112222 040200: Test OK @

Nucleus Name	DS_SDRAM_Read
Nucleus Number	403
Description	Read from a specific memory address
User Input	The location from which the data must be read (SDRAM starts at address 0xA0000000)
Example	DS:> 403 0xa1000010 040300: Value read = 0xAD112222 Test OK @

FLASH

Nucleus Name	DS_FLASH_DevTypeGet
Nucleus Number	500
Description	Get the device (revision) type information of the FLASH IC. (manufacturer and device ID)
User Input	None
Example	DS:> 500 050000: Found FLASH memory: Manufacturer ID: 0x01 Device ID : 0x01 Test OK @

Nucleus Name	DS_FLASH_WriteRead
Nucleus Number	501
Description	Check whether the FLASH can be written to and read from
User Input	None
Example	DS:> 501 050100: Test OK @

Nucleus Name	DS_FLASH_Read
Nucleus Number	502
Description	Read from a specific memory address in FLASH
User Input	The location from which data must be read (FLASH starts at address 0xB8000000)
Example	DS:> 502 0xb8000000 050200: Value read = 0x3C08A000 Test OK @

Nucleus Name	DS_FLASH_ChecksumProgram
Nucleus Number	503
	Check the checksum of the application partitions by recalculating and comparing partition checksums
User Input	None

Nucleus Name	DS_FLASH_CalculateChecksum
Nucleus Number	504
Description	Calculate the checksum over all memory addresses. Used to check entire FLASH contents
User Input	None
Example	DS:> 504 050400: The Checksum = 0xBABE30A4 Test OK @

Nucleus Name	DS_FLASH_CalculateChecksumFast
Nucleus Number	505
Description	Calculate a checksum over a selected number of address locations
User Input	None
Example	DS:> 505 050500: The Checksum = 0xBABEB064 Test OK @

Video Input Processor (VIP)

Nucleus Name	DS_VIP_DevTypeGet
Nucleus Number	600
Description	Get the device (revision) type information of the VIP IC
User Input	None
Example	DS:> 600 060000: Found SAA7118 Test OK @

Nucleus Name	DS_VIP_Communication
Nucleus Number	601
Description	Check the communication between the IIC controller of the chrysalis and the VIP IC
User Input	None
Example	DS:> 601 060100: Test OK @

Nucleus Name	DS_VIP_ClockOutputOn
Nucleus Number	602
Description	Switch the clock output on
User Input	None
Example	DS:> 602 060200: Test OK @

Nucleus Name	DS_VIP_ClockOutputOff	
Nucleus Number	603	
Description	Switch the clock output off	
User Input	None	
Example	DS:> 603 060300: Test OK @	

Nucleus Name	DS_VIP_SelectInput
Nucleus Number	604
Description	Select an input video path to be switched to the analogue output pin (AOUT) of the VIP

User Input	The input to select, see table below.
Osci input	
	1 CVBS_Y_IN_A
	2 CVBS_OUT_B
	3 CVBS_Y_IN_B
	4 CVBS_Y_IN_C
	6 C_IN
	8 G_IN
	9 Y_IN
	13 B_IN
	14 U_IN
	18 R_IN
	19 V_IN
Example	DS:> 604 1
	060400:
	Test OK @

Digital Video Input Output (DVIO)

Nucleus Name	DS_DVIO_LinkDevTypeGet
Nucleus Number	700
Description	Get the device (revision) type information of the 1394 Link layer IC
User Input	None
Example	DS:> 700 070000: Device type of the link layer IC: ffc00301 Test OK @

Nucleus Name	DS_DVIO_PhyDevTypeGet
Nucleus Number	701
Description	Get the device (revision) type information of the 1394 Physical layer IC
User Input	None
Example	DS:> 701 070100: Device type of the phy layer IC: 0 Test OK @

Nucleus Name	DS_DVIO_LinkCommunication
Nucleus Number	702
Description	Check the accessibility of the 1394 Link layer IC by writing to and reading from a specific address
User Input	None
Example	DS:> 702 070200: Test OK @

Nucleus Name	DS_DVIO_PhyCommunication	
Nucleus Number	703	
Description	Check the accessibility of the 1394 Physical layer IC by writing to and reading from a specific address	
User Input	None	
Example	DS:> 703 070300: Test OK @	

Nucleus Name	DS_DVIO_Routing
Nucleus Number	704
Description	Route a DV stream containing an audio and video signal through the physical and link layer ICs to the Chrysalis
User Input	None, test works for both NTSC and PAL
Example	DS:> 704 070400: Test OK @

Nucleus Name	DS_DVIO_DetectNode
Nucleus Number	705
Description	Check whether a DV node can be detected by the hardware
User Input	None, test works for both NTSC and PAL

Example	DS:> 705
	070500:
	Test OK @

Nucleus Name	DS_DVIO_DetectStream
Nucleus Number	706
Description	Check whether a DV stream can be detected by the hardware
User Input	None, test works for both NTSC and PAL
Example	DS:> 706 070600: Test OK @

Progressive Scan (PSCAN)

Nucleus Name	DS_PSCAN_CommunicationDenc
Nucleus Number	801
Description	Check the communication between the IIC controller of the chrysalis and the progressive scan DENC-IC
User Input	None
Example	DS:> 801 080100: Test OK @

Nucleus Name	DS_PSCAN_TestImageOn
Nucleus Number	802
Description	Generate the test images that are present on the progressive scan IC.
User Input	In case of ADV7196: When no input is given "HATCH" is the default -"HATCH" -"FRAME" Remark: "HATCH" is a crosshatch test pattern (horizontal and vertical white lines are displayed against a black background) "FRAME" is a uniform coloured frame/field test pattern (default white). In case of FLI2300: Nothing.
Example	DS:> 802 HATCH 080200: Test OK @

Nucleus Name	DS_PSCAN_TestImageOff
Nucleus Number	803
Description	Switch off the generated test image
User Input	None
Example	DS:> 803 080300: Test OK @

Nucleus Name	DS_PSCAN_TestImageColourSettingsSet
Nucleus Number	804
Description	Set the colour of the hatch- or the frame- field to a different value than the default white
User Input	A colour string of one of the next non-case sensitive strings (WHITE, BLACK, RED, GREEN, BLUE, YELLOW, CYAN, MAGENTA) or Y Cr Cb (hexa-) decimal values.
Example	DS:> 804 yellow 080400: Test OK @ DS:> 804 0x6a 0xde 0xca 080400: Test OK @

Nucleus Name	DS_PSCAN_TestImageColourSettingsGet
Nucleus Number	805
Description	Get the colour settings of the hatch- or the frame- field.
User Input	None
Example	DS:> 805 080500: Colour Y Cr Cb values: 0xD2 0x92 0x10 Test OK @

Nucleus Name	DS_PSCAN_Routing
Nucleus Number	806
Description	Route a video signal from the host processor through the progressive scan ICs to the progressive scan output of the set. Note: to route the progressive scan to the output of the set, first call nucleus 1112 with parameter 0 (video routing on analogue board).
User Input	None
Example	DS:> 806 080600: Test OK @

Nucleus Name	DS_PSCAN_DevTypeGetDeinterlacer
Nucleus Number	807
Description	Get the device (revision) type information of the progressive scan deinterlacer.
User Input	None
Example	DS:> 807
	080700:
	Chip name : 2300
	Chip version: 1
	Test OK @

Nucleus Name	DS_PSCAN_CommunicationDeinterlacer
Nucleus Number	808
Description	Check the communication between the IIC controller of the chrysalis and the progressive scan Deinterlacer-IC
User Input	None
Example	DS:> 808 080800: Test OK @

Basic Engine (BE)

Nucleus Name	DS_BE_CommunicationEcho
Nucleus Number	900
Description	Check the communication between the digital board and the basic engine by issuing an echo command over the S2B interface
User Input	None
Example	DS:> 900 090000: Test OK @

Nucleus Name	DS_BE_Reset
Nucleus Number	901
Description	Reset the basic engine
User Input	None
Example	DS:> 901 090100: Test OK @

Nucleus Name	DS_BE_VersionGet
Nucleus Number	903
Description	Get the version of the basic engine and that of the optical unit
User Input	None
Example	DS:> 903 090300: BE version = 20.09.18 Optical unit version = 3C.00.09.41.08 Test OK @

Nucleus Name	DS_BE_GetSelftestResult
Nucleus Number	902
Description	Return the self-test results through the service port
User Input	None
	DS:> 902 090200: Test OK @

Diagnostic Software

Nucleus Name	DS_BE_TrayIn
Nucleus Number	905
Description	Close the tray of the basic engine
User Input	None
Example	DS:> 905 090500: Test OK @

Nucleus Name	DS_BE_WriteReadDvdRw
Nucleus Number	906
Description	Write data to and read data from a DVD+RW disc through the basic engine for verification of the writing
User Input	None
Example	DS:> 906 090600: Testing on sector 0x5dbe0: OK Test OK @

Nucleus Name	DS_BE_WriteReadDvdR
Nucleus Number	907
Description	Write data to and read data from a DVD+R disc through the basic engine for verification of the writing
User Input	None
Example	DS:> 907 090700: Testing on sector 0x36210: OK Test OK @

Nucleus Name	DS_BE_StatisticalInformationGet	
Nucleus Number	908	
Description	Retrieve the statistical information from the basic engine	
User Input	None	
Example	DS:> 908 Number of times Tray went Open/Closed : 4 Total minutes the CD laser was on : 0 Total minutes the DVD laser was on : 0 Total minutes the write laser was on : 0 090800: Test OK @	

Nucleus Name	DS_BE_StatisticalInformationReSet
Nucleus Number	909
Description	Reset the statistical information in the basic engine
User Input	None
Example	DS:> 909 090900: Test OK @

Nucleus Name	DS_BE_ErrorLogGet
Nucleus Number	910
Description	Get the error log from the basic engine
User Input	None
Example	DS:> 910 Momentary errors (0-9): 0x21 0x00 0x00 0x20 0x00 0x00 0x00 0x00

Nucleus Name	DS_BE_ErrorLogReset
Nucleus Number	911
Description	Reset the error log in the basic engine
User Input	None
Example	DS:> 911 091100: Test OK @

Nucleus Name	DS_BE_JitterOptimise
Nucleus Number	912
Description	Perform jitter optimisation: A formatted DVD must be loaded into the engine before executing this nucleus
User Input	none
Example	DS:> 912 Test OK @

Nucleus Name	DS_BE_FocusOn
Nucleus Number	913
Description	Put the laser of the BE into focus
User Input	None
Example	DS:> 913 091300: Test OK @

Nucleus Name	DS_BE_FocusOff
Nucleus Number	914
Description	Turn off putting the laser of the BE into focus
User Input	None
Example	DS:> 914 091400: Test OK @

Nucleus Name	DS_BE_MotorOn
Nucleus Number	915
Description	Turn on the turntable motor
User Input	None
Example	DS:> 915 091500: Test OK @

Nucleus Name	DS_BE_MotorOff
Nucleus Number	916
Description	Turn off the turntable motor
User Input	None
Example	DS:> 916 091600: Test OK @

Nucleus Name	DS_BE_RadialOn
Nucleus Number	917
Description	Close the radial loop
User Input	A formatted DVD must be loaded into the engine before executing this nucleus
Example	DS:> 917 091700: Test OK @

Nucleus Name	DS_BE_RadialOff
Nucleus Number	918
Description	Open the radial loop
User Input	None
Example	DS:> 918 091800: Test OK @

Nucleus Name	DS_BE_RadialCalibration
Nucleus Number	919
Description	Calibrate the radial loop
User Input	A formatted DVD must be loaded into the engine before executing this nucleus
Example	DS:> 919 091900: Test OK @

Nucleus Name	DS_BE_Tilt
Nucleus Number	920
Description	Test the tilt mechanism control loop, or allow its proper functioning to be measured. Before executing this nucleus a disc must be loaded into the recorder
User Input	None
Example	DS:> 920 092000: Tilt sensor bathtub: (71,-12,145)(68,-12,135)(62,-10,120)(56,-92,97)(50,-75,86) (44,-59,80)(41,-52,80)(35,-37,86)(29,-22,86) (23,-7,92)(17,8,111)(11,23,135)(8,31,138)(5,39,158) Test OK @

Nucleus Name	DS_BE_CheckDisc
Nucleus Number	921
Description	Check whether there is a disc inside the BE
User Input	None
Example	DS:> 921 092100: A DVD+Rewritable is loaded (disc is empty or partially recorded) Test OK @ DS:> 921 092100: No Disc is loaded Test OK @

Nucleus Name	DS_BE_SledgeMotor
Nucleus Number	922
Description	Send the sledge to its home position, then to the middle of the disc, and then to the end.
User Input	None
Example	DS:> 922 092200: Test OK @

Nucleus Name	DS_BE_ReadTocInfo
Nucleus Number	924
Description	Read the TOC from the disc. This gives a good indication if the BE works properly
User Input	None
Example	DS:> 924 092400: TOC info [hex] = 91 3A 0C Test OK@ DS:> 924 092403: The BE returned: 0x10 #{no_disc_error} No disc is detected Error@ DS:> 924 092403: The BE returned: 0x1e #{illegal_medium_error} Engine unable to handle current disc. Probably illegal medium. Error @

Nucleus Name	DS_BE_DiscErase
Nucleus Number	925
Description	Perform a DC-erase on a DVD+RW disc.
User Input	None

Example	DS:> 925
	The entirely disc will be erased.
	Are you sure you want this?[y/n]
	092500: Test OK @

Nucleus Name	DS_BE_RegionCodeSet
Nucleus Number	928
Description	Set the region code in the AV3.
User Input	Region code
Example	DS:> 928 1 092800: Test OK @ DS:> 928 This nucleus is not supported by the engine
	092800: Test OK @

Nucleus Name	DS_BE_RegionCodeGet
Nucleus Number	929
Description	Read the region code from the AV3.
User Input	None
Example	DS:> 929 092900: DVD region 1 Test OK @
	DS:> 929This nucleus is not supported by the engine 092900: Test OK @

Nucleus Name	DS_BE_RegionCounterReset
Nucleus Number	930
Description	Reset the region counter in the AV3.
User Input	None
Example	DS:> 930 093000: Test OK @ DS:> 930 This nucleus is not supported by the engine 093000: Test OK @

Display and Control Board (DCB)

Nucleus Name	DS_DCB_CommunicationEcho
Nucleus Number	1000
Description	Check the communication between the digital board and the DCB by issuing an echo command
User Input	None
Example	DS:> 1000 100000: Test OK @

Nucleus Name	DS_DCB_VersionGet
Nucleus Number	1001
Description	Get the version of the DCB
User Input	None
Example	DS:> 1001 100100: DCB version: 13 Test OK @

Nucleus Name	DS_DCB_LightDisplay
Nucleus Number	1002
	Light the entire display of the DCB, and clear the display after confirmation. User confirmation is necessary.
User Input	None

Example	DS:> 1002
	100200:
	Test OK @

Nucleus Name	DS_DCB_Keyboard	
Nucleus Number	1004	
Description	Check all keys of the keyl	poard by confirming the key-code displayed of each key.
User Input	None	
Example	DS:> 1004 100400: Test OK @	

Nucleus Name	DS_DCB_RemoteControl
Nucleus Number	1005
Description	Check the interface between the remote control and the DCB by checking the key-code displayed
User Input	None
Example	DS:> 1005 100500: Test OK @

Nucleus Name	DS_DCB_Led	
Nucleus Number	1006	
Description	7 .	and after confirmation off. ing the REC key, STOP key, or the PLAY key on the local onfirms that the LED is on and the REC key
User Input	None	
Example	DS:> 1006 100600: Test OK @	

Analogue Board (ANAB)

Nucleus Name	DS_ANAB_CommunicationEcho
Nucleus Number	1100
Description	Check the communication between the digital board and the analogue board by issuing some echo string.
User Input	None
Example	DS:> 1100 110000: Hello Analogue Board Test OK @

Nucleus Name	DS_ANAB_CommunicationlicNvram
Nucleus Number	1101
Description	Check the communication between the digital board and the NVRAM on the analogue board.
User Input	None
Example	DS:> 1101 110100: Test OK @

Nucleus Name	DS_ANAB_CommunicationlicTuner
Nucleus Number	1102
Description	Check the communication between the digital board and the tuner on the analogue board
User Input	None
Example	DS:> 1102 110200: Test OK @

Nucleus Name	DS_ANAB_CommunicationlicDataSlicer
Nucleus Number	1103
Description	Check the communication between the digital board and the data slicer on the analogue board
User Input	None

Example	DS:> 1103
	110300:
	Test OK @

Nucleus Name	DS_ANAB_CommunicationlicSoundProcessor
Nucleus Number	1104
Description	Check the communication between the digital board and the sound processor on the analogue board
User Input	None
Example	DS:> 1104 110400: Test OK @

Nucleus Name	DS_ANAB_CommunicationlicAVSelector
Nucleus Number	1105
Description	Check the communication between the digital board and the A/V-selector on the analogue board
User Input	None
Example	DS:> 1105 110500: Test OK @

Nucleus Name	DS_ANAB_HardwareVersionGet
Nucleus Number	1106
Description	Get the hardware version of the analogue board
User Input	None
Example	DS:> 1106 110600: Analogue hardware version : 11 Test OK @

Nucleus Name	DS_ANAB_SoftwareVersionBootGet
Nucleus Number	1107
Description	Get the software version of the boot software of the analogue board
User Input	None
Example	DS:> 1107 110700: Bootcode application version : 11.00.11 Test OK @

Nucleus Name	DS_ANAB_SoftwareVersionDownloadGet
Nucleus Number	1108
Description	Get the software version of the download software of the analogue board
User Input	None
Example	DS:> 1108 110800: Download application version : 11.00.06 Test OK @

Nucleus Name	DS_ANAB_SoftwareVersionApplGet
Nucleus Number	1109
Description	Get the software version of the application software of the analogue board
User Input	None
Example	DS:> 1109 110900: Recorder application version : 11.00.23 Test OK @

Nucleus Name	DS_ANAB_SoftwareVersionDiagnosticsGet
Nucleus Number	1110
Description	Get the software version of the diagnostic software of the analogue board
User Input	None
Example	DS:> 1110 111000: Diagnostics application version : 11.00.13 Test OK @

Nucleus Name	DS_ANAB_ChecksumProgram
Nucleus Number	1111

Description	Check the checksum of the several partitions by recalculating and comparing partition checksums
User Input	None
Example	DS:> 1111 BootCode checksum is: 0xBABE6240, which is correct Diagnostics checksum is: 0xBABEBEAD, which is correct Download checksum is: 0xBABEA6B7, which is correct Application checksum is: 0xBABEB277, which is correct 111100: Test OK @

Nucleus Name	DS_ANAB_VideoRouting
Nucleus Number	1112
Description	Perform the routing of the video paths on the analogue board
User Input	The user has to input the correct parameter for the routing (see table 'video routing' below).
Example	DS:> 1112 00 111200: Test OK @

Video routing paths (Europe)

Path ID	Description
0	Input signal is VIDEO(CVBS) from digital board and will be re-routed back to the digital board.
1	Input signal is from FRONT VIDEO(CVBS) IN and will be routed to the digital board.
2	No Routing.
3	Input signal is from FRONT S-VIDEO(Y/C) and will be routed to the digital board.
4	No Routing.
5	Input signal is CVBS from SCART1 and will be routed to the digital board.
6	Input signal is CVBS from SCART2 and will be routed to the digital board.
7	Input Signal is CVBS from Digital Board and it will be routed to Scart1 and Scart2.
8	Input signal is VIDEO(CVBS) from ANTENNA IN and will be routed to SCART2.
9	Input signal is VIDEO(CVBS) from SCART1 and will be routed to SCART2.
10	Input signal is VIDEO(CVBS) from SCART2 and will be routed to SCART1.
11	Signal path is routed Fast Blank from Scart2 pin16 and will be routed SCART1 pin16
12	Input Signal is YC from Digital Board and it will be routed to SCART1.
13	
14	No Routing.
15	Input Signal is CVBS from TUNER and it will be routed to Digital .
16	No Routing.
17	Input Signal is routed from digital board YC to REAR S-VIDEO(YC) OUT
18	Signal path is routed from digital board RGB to RGB SCART1 and from digital board CVBS to digital board CVBS.
19	No Routing.
20	Input RGB Signal is routed from Digital Board to SCART1(RGB),Input CVBS Signal from Digital Board to Digital Board and Fast Blanking Signal from SCART2 to SCART1.
21	Input Y/C Signal from Digital Board is routed to Rear Y/C Connector and Input Y/C Signal from Front Y/C connector is routed to Digital Board.

Video routing paths (NAFTA)

ideo fouting patris (IVAF IA)	
Path ID	Description
0	No Routing.
1	Input signal is from FRONT VIDEO(CVBS) IN and will be routed to the digital board. This routing is same as the above path id.
0	5
2	Input signal is from REAR VIDEO(CVBS) IN and will be routed to the digital board.
3	Input signal is from FRONT S-VIDEO(Y/C) IN and the signal received will be routed to the digital board.
4	Input signal is from REAR S-VIDEO(Y/C) IN and will be routed to the digital board.
5	No Routing.
6	No routing.
7	No routing.
8	Input signal is VIDEO(CVBS) from TUNER and will be routed to Y Pin of Rear Y/C Connector.This will give only black/White Picture .
9	Input signal is from YUV IN and will be routed to YUV OUT. This is possible only if Digital Board routes back YUV signal received back to the Analogue board (DENC)

10	No routing.
11	No routing.
12	No Routing.
13	No Routing.
14	No Routing.
15	Input CVBS Signal from Tuner is routed to Digital Board
16	No Routing.
17	No Routing.
18	Input Signal from CVBS Rear In is routed to Digital Board. This is the same as path ID 02.
19	Input Y/C signal from Digital Board is routed to Y/C Rear Out Connector and Input signal from Y/C Front In Connector is routed to Y/C Digital Board.
20	Y/C signal from Digital Board is routed to Y/C Rear Out Connector and Input signal from Y/C Rear In Connector is routed to Y/C Digital Board.
23	The Video signal received from the Digital board will be output on Modulator channel 3.
24	The Video signal received from the Digital board will be output on Modulator channel 4.

Nucleus Name	DS_ANAB_AudioRouting
Nucleus Number	1113
Description	Perform the routing of the audio paths on the analogue board
User Input	The user has to input the correct parameter for the routing (see table 'audio routing' below)
Example	DS:> 1113 00 111300: Test OK @

Audio routing paths (Europe)

Path ID	Description
0	Input signal is from FRONT AUDIO IN and will be routed to the digital board.
1	Input signal is from FRONT AUDIO IN and will be routed to the digital board.
2	No Routing.
3	Input signal is AUDIO from SCART1 and will be routed to the digital board.
4	Input signal is AUDIO from SCART2 and will be routed to the digital board.
5	No routing.
6	No routing.
7	Input Audio signal is from the digital Board and it will be routed to the SCART1 and SCART2
8	Input AUDIO signal from TUNER and will be routed to SCART2.
9	Input signal is AUDIO from SCART1 and will be routed to SCART2.
10	Input audio signal from SCART2 is routed to SCART1.
11	Input Audio signal is routed from DVIO to SCART2.
12	
13	No Routing.
14	Input is Audio Signal from DVIO and it will be routed to Digital Board.
15	Input is Audio Signal from TUNER and it will be routed to Digital Board
16	No routing.
17	No Routing.
18	Input signal is from FRONT AUDIO IN and will be routed to SCART2.
21	Input signal is from FRONT AUDIO IN and will be routed to the digital board.

Audio routing paths (NAFTA)

Path ID	Description
0	No Routing.
1	Input signal is from FRONT AUDIO IN and will be routed to the digital board.
2	Input signal is from REAR AUDIO IN 2 and will be routed to the digital board.
3	Input Audio Signal is routed from FRONT Cinch In to Digital Board.(This is same as path ID 01)
4	Input Signal is from Rear Cinch In1 and it will be routed to Digital Board
5	No routing.
6	No routing.
7	No routing.
8	No Routing.
9	No routing.
10	No Routing.
11	No Routing.
12	No Routing.

Diagnostic Software

Nucleus Name	DS_ANAB_SelectTunerChanne	I	
Nucleus Number	1114		
Description	Set the tuner to receive a valid au	dio and video signal	
User Input	<frequency*16> <video id="" standard=""> Tuner frequency: to tune the tuner to e.g. 216 MHz, this parameter must be 3456. (Since 216*16 = 3456. This is to avoid the decimal points to the parameter list.) Video standard id: The table below shows which video standards are possible</video></frequency*16>		
	Video standard id	Europe	NAFTA
	16	PAL_BG	NTSC
	32	PAL_I	Invalid
	48	PAL_DK	Invalid
	64 80	SEC_L	Invalid
	96	SEC_LS	Invalid
	112	SEC_BG	Invalid
		SEC_DK	Invalid
Example	DS:> 1114 3456 16 111400: Test OK @	,	•

Nucleus Name	DS_ANAB_IICWriteRead
Nucleus Number	1115
Description	Perform an IIC write and read action on the analogue board
User Input	Writing: [<w> <w>] [I2C address] [number of data bytes to write] with <data[0]data[n]> Max 16 data bytes (n < 16). Reading: [<r> <r>] [I2C address] [number of data bytes to read] Max 16 data bytes (n < 16).</r></r></data[0]data[n]></w></w>
Example	DS:> 1115 w 0x94 2 0x06 0x02 111500: Test OK @

Nucleus Name	DS_ANAB_ClockAdjust
Nucleus Number	1116
Description	Set the clock to the value passed through in the YYYY MM DD HH MM SS format
User Input	<yyyy> <mm> <dd> <hh> <mm> <ss></ss></mm></hh></dd></mm></yyyy>
Example	DS:> 1116 2002 11 11 11 11 11 111600: Test OK @

Nucleus Name	DS_ANAB_ClockReference
Nucleus Number	1117
Description	Generate a 1 kHz signal on pin 7 (INT) of the clock IC
User Input	None
Example	DS:> 1117 111700: Test OK @

Nucleus Name	DS_ANAB_ClockCorrection
Nucleus Number	1118

Description	Store the clock IC correction value in NVRAM
User Input	The correction value for the clock
· · · · · · · · · · · · · · · · · · ·	DS:> 1118 1000023 111800: Test OK @

Nucleus Name	DS_ANAB_TunerAFCReferenceVoltage
Nucleus Number	1119
Description	Store the reference voltage for the tuner in NVRAM
User Input	The reference voltage, between 0 and 255
Example	DS:> 1119 5 111900: Test OK @

Nucleus Name	DS_ANAB_TunerFrequencyDownload	
Nucleus Number	1120	
Description	Store the frequency table in NVRAM. The frequency table is passed through the error- string provided to the nucleus.	
User Input	See frequency table	
Example	DS:> 1120 2233 00 02 4E45442031 112000: Test OK @	

Frequency download string format

Format	description	remarks
X(XXX)	Preset number	
VVWW	VV: Channel number WW : Channel offset	
ZZ	Byte containing 8 bit fields for TRUE/FALSE: BIT 0: Decoder BIT 1: Modulation BIT 2: NICAM SAP BIT 3: Satpreset BIT 4: Presetdefined Channelpreferred BIT 5: ExtPreset BIT 6: NameManuallyChanged BIT 7: ChannelPreset	NICAM/stereo bit for Europe SAP/stereo bit for NAFTA Preset defined bit is only used for Europe. For NAFTA, it is renamed as channelpreferred to indicate if a channel is preferred or not. TRUE if preset is defined from P50 as extern [TGA]
НН	HfSystemFineTuning	HfS: 4 bit, FT: -4,,4
IIJJKKLLMM	Netname	Range: A,,Z,0,,9,_, Netname length exists for Europe only. 'II' is the HEX-value for the first character, 'JJ' for the second, Ö

The message string of (DS_MessageDef *msgString) should be in the format:

"X(XXX)_VVWW_ZZ_HH_IIJJKKLLMM".

Here will be 'X(XXX)' a decimal value in the range of 0 to 255.

V, W, Z, H, I, J, K, L, M are hex values with out the prefix '0x' (in the range 0... 9,A ... F)

Remarks:

CHANNEL_SYSTEM is for NAFTA.

PRESET_SYSTEM is for Europe.

Nucleus Name	DS_ANAB_StoreExternalPresets	
Nucleus Number	1121	
Description	Store the external presets in NVRAM	
User Input	None	
Example	DS:> 1121 112100: Test OK @	

Nucleus Name	DS_ANAB_BargraphLevelAdjust
Nucleus Number	1122
'	Measure the audio signal corresponding to 0dB per channel and store it as correction value in NVRAM

[&]quot;_" Denotes a space character.

User Input	none
Example	DS:> 1122 112200: Test OK @

System (SYS)

Nucleus Name	DS_SYS_HardwareVersionGet
Nucleus Number	1200
Description	Get the hardware version and type of the digital board
User Input	None
Example	DS:> 1200 120000: Hardware ID = 00 The (PIO-pins) Digital Board ID = 2 Test OK @ DS:>

Nucleus Name	DS_SYS_SoftwareVersionBootGet	
Nucleus Number	1201	
Description	Get the version of the boot software on the digital board	
User Input	None	
Example	DS:> 1201 120100: Software Boot Version = 0001 Test OK @	

Nucleus Name	DS_SYS_SoftwareVersionDownloadGet
Nucleus Number	1202
Description	Get the version of the download software on the digital board
User Input	None
Example	DS:> 1202 120200: Software Download Version = 0001 Test OK @

Nucleus Name	DS_SYS_SoftwareVersionApplGet
Nucleus Number	1203
Description	Get the version of the application software on the digital board
User Input	None
Example	DS:> 1203 120300: Software Application Version = 0001 Test OK @

Nucleus Name	DS_SYS_Softwa	reVersionDiagnosticsGet
Nucleus Number	1204	
Description	Get the version of	the diagnostics software on the digital board
User Input	None	
Example	DS:> 1204 120400: Software Test OK @	Diagnostics Version = 0001
	120503	Something went wrong while transferring the data.
	120504	User cancelled the upload.
Example	DS:> 1205 1 120500: Test OK @	

Nucleus Name	DS_SYS_EepromUpload	
Nucleus Number	1205	
Description	Upload the contents of the NVRAM on the analogue board or the digital board to the service PC, by using the X-modem protocol	
User Input	Choose one of the following parameters for the nucleus: 1. Upload the contents of the NVRAM of the digital board 2. Upload the contents of the NVRAM of the analogue board Choose in the terminal on the control PC -> transfer -> receive file. Select X-modem protocol. Then click receive in the dialogue and fill in the file name in which you want to store the data.	

Nucleus Name	DS_SYS_EepromDownload	
Nucleus Number	1206	
Description	Download a file with the contents of the NVRAM for the analogue board or the digital board from the service PC to the recorder, by using the X-modem protocol	
User Input	Choose one of the following parameters for the nucleus: 1. Download the contents of the NVRAM of the digital board 2. Download the contents of the NVRAM of the analogue board Choose in the terminal of the control PC -> transfer -> send file. Select X-modem protocol. Then choose a file with the Browse button in the dialogue and click on send.	
Example	DS:> 1206 1 120600: Test OK @	

Nucleus Name	DS_SYS_DvIdNumberGet
Nucleus Number	1208
Description	Get the IEEE1394 ID
User Input	None
Example	DS:> 1208 120800: The DvldNumber is: 0x0C22384E5A Test OK @

Nucleus Name	DS_SYS_licWrite	
Nucleus Number	1209	
Description	Perform an IIC write action on the digital board	
User Input	The user input the number of bytes to write followed by these bytes: <busid><slave address="" to="" write=""><number bytes="" of="" to="" write=""><d1><d2><><dx> Where the bus ID is either 0 (normally used) or 1</dx></d2></d1></number></slave></busid>	
Example	DS:> 1209 0 0xa0 1 0x6 120900: 1 Bytes written Test OK @	

Nucleus Name	DS_SYS_licRead
Nucleus Number	1210
Description	Perform an IIC read action on the digital board
User Input	The user inputs the number of bytes to read and the address to read them from: <busid><slave address="" from="" read="" to=""><number bytes="" of="" read="" to=""> Where the bus ID is either 0 (normally used) or 1</number></slave></busid>
Example	DS:> 1210 0 0xa0 1 121000: Value read =0x06 Test OK @

Nucleus Name	DS_SYS_UartWrite
Nucleus Number	1211
Description	Perform an UART write action on the digital board on a specified UART
User Input	The user inputs the UART to write to, the number of bytes and the bytes to be written to the UART. 1=UART port 1: not used 2=UART port 2: Bit Engine 3=UART port 3: Analogue board <uartnr><number bytes="" of="" to="" write=""><d1><d2><><dx></dx></d2></d1></number></uartnr>
Example	DS:> 1211 2 2 0xd1 0x01 121100: Test OK @

Nucleus Name	DS_SYS_UartRead
Nucleus Number	1212
Description	Perform an UART read action on the digital board on a specified UART
User Input	The user inputs the UART to read from. 1=UART port 1 : not used 2=UART port 2 : Bit Engine 3=UART port 3 : Analogue board <uartnr></uartnr>
Example	DS:> 1212 2 121200: The value that was read is: 0x50 0xD1 0x00 Test OK @

Nucleus Name	DS_SYS_VideoLoopThroughStart
Nucleus Number	1213
Description	The video signal, which is confirm the user input, is routed from the input to the output. Input is set with the routing nucleus 1112. All outputs are enabled.
User Input	<vipinput> <videooutput> <videostandard> vipInput (CVBS, YC, YUV, RGB). VideoOutput (YUV, RGB). VideoStandard (PAL, NTSC). </videostandard></videooutput></vipinput>
Example	DS:> 1213 CVBS RGB PAL 121300: Test OK @

Nucleus Name	DS_SYS_VideoLoopThroughStop
Nucleus Number	1214
Description	Stop routing the video input to all the outputs.
User Input	-
Example	DS:> 1214 121400: Test OK @

Nucleus Name	DS_SYS_VideoLoop
Nucleus Number	1215
Description	Note: Before executing this nucleus the user must route the video signal on the analog board with nucleus DS_ANAB_VideoRouting(1112).
User Input	Video input of the digital board: - CVBS - YC - YUV - RGB - TEST (The video output will be routed to the video input on the digital board.) Video standard: - PAL - NTSC When no input is given, the nucleus will take TEST for video input and PAL for video standard.
Example	DS:> 1215 cvbs ntsc 121500: Test OK @ DS:> 1215 cvbs pal 121508: The VideoInputProcessor cannot detect a sync-signal. Error @ DS:> 1215 yuv ntsc 121511: Error in luminance signal(Y) Error in chrominance signal(U) Error @ Error @

Nucleus Name	DS_SYS_SlashVersionSet
Nucleus Number	1217
Description	Set the slash version of the system
User Input	The slash version
Example	DS:> 1217 82 121700: Test OK @

Nucleus Name	DS_SYS_SlashVersionGet
Nucleus Number	1218
Description	Get the slash version of the system
User Input	None
Example	DS:> 1218 121800: The slash version is: 82 Test OK @

Nucleus Name	DS_SYS_Virginize
Nucleus Number	1219

Description	(Re-) Virginize the recorder. User data in the NVRAM of the analogue board is cleared
Example	DS:> 1219
	121900:
	Test OK @

Nucleus Name	DS_SYS_VirginModeOn
Nucleus Number	1220
Description	Turn on the virgin mode functionality (e.g. the auto channel search upon start-up)
User Input	None
Example	DS:> 1220 122000: Test OK @

Nucleus Name	DS_SYS_VirginModeOff
Nucleus Number	1221
Description	Turn off the virgin mode functionality (e.g. the auto channel search upon start-up)
User Input	None
Example	DS:> 1221 122100: Test OK @

Nucleus Name	DS_SYS_DisplayFatalOn
Nucleus Number	1223
Description	Turn on the display-fatal functionality which displays debug-information on the display when encountering a fatal error condition from which could not be recovered automatically
User Input	None
Example	DS:> 1223 122300: Test OK @

Nucleus Name	DS_SYS_DisplayFatalOff
Nucleus Number	1224
Description	Turn off the display-fatal functionality which displays debug-information on the display when encountering a fatal error condition from which could not be recovered automatically
User Input	None
Example	DS:> 1224 122400: Test OK @

Nucleus Name	DS_SYS_DisplayFatalGet
Nucleus Number	1225
Description	Get the display-fatal flag of the recorder
User Input	None
Example	DS:> 1225 122500: Test OK @

Nucleus Name	DS_SYS_SettingsSet
Nucleus Number	1226
Description	Programs the digital board settings into the boot EEPROM on the digital board.
User Input	A large hexadecimal value that represents the digital board settings obtained from the DbString.exe program or from a reference set.
Example	DS:> 1226 646961677473746201010200010101010101000020080000 122600: Test OK @

Nucleus Name	DS_SYS_SettingsDisplay
Nucleus Number	1228
Description	Show the settings that are programmed in the BROM on the digital board.
User Input	None.

Example	DS:> 1228
·	Settings ID: 6D7920626F61726400020300010101020101000020080000
	Board name: my board
	Hardware ID: 0
	Codec IC: PNX7100_MF2
	Video Input Processor IC: SAA7118
	Progressive Scan Deinterlacer IC: None
	Progressive Scan Denc IC: ADV7196
	I-Link physical layer circuit IC: PDI1394P25
	I-Link link layer circuit IC: PDI1394P40
	Audio clock: Clock scheme 1
	Bit engine connector: available
	IDE connector 1: available
	IDE connector 2: not available
	PCI connector: not available
	RAM size 32MByte
	ROM size (NOR FLASH bank 1) 8MByte
	ROM size (NOR FLASH bank 2) Not available
	ROM size (NAND FLASH) Not available
	Bit Engine: AV 2.0
	122800:
	Test OK @

Nucleus Name	DS_SYS_SettingsGet
Nucleus Number	1229
Description	Get the digital board diversity settings string that is programmed in the BROM on the digital board.
User Input	None.
Example	DS:> 1229 122900: 6D7920626F61726400020300010101020101000020080000 Test OK @

Nucleus Name	DS_SYS_AudioLoopThroughStart
Nucleus Number	1230
Description	Description: The audio input is routed from the an input to all outputs. Input is set with the routing nucleus 1113. All outputs are enabled.
User Input	None.
Example	DS:> 1230 123000: Test OK @

Nucleus Name	DS_SYS_AudioLoopThroughStop
Nucleus Number	1231
Description	Stop routing the audio input to all the outputs
User Input	-
Example	DS:> 1231
	123100:
	Test OK @

Electronic Program Guide Board (EPGB)

Nucleus Name	DS_EPGB_VersionGet
Nucleus Number	1300
Description	Returns the version of the EPG board.
User Input	None
Example	DS:> 1300 130000: Version: 6.1.9 Test OK @

PCMCIA INTERFACE (PCMCIA)

Nucleus Name	DS_PCMCIA_Reset
Nucleus Number	1400
Description	Reset the PCMCIA device by sending a reset command through IDE
Example	DS:> 1400 140000:
	Test OK @

Nucleus Name	DS_PCMCIA_Inquiry
Nucleus Number	1401
Description	Get the vendor- and product identification and the product revision level of the media in the slot.
Example	DS:> 1401 140100: Test OK @

Nucleus Name	DS_PCMCIA_WriteRead
Nucleus Number	1402
Description	Perform a Write Read test to a random sector on the inserted medium in the PCM-CIA device and check if the data read is equal to the data written.
Example	DS:> 1402 140200: Test OK @

Nucleus Name	DS_PCMCIA_Diagnostics
Nucleus Number	1403
Description	Shall perform the internal diagnostic tests implemented by the media in the slot.
Example	DS:> 1403
	140300:
	Test OK @

Script

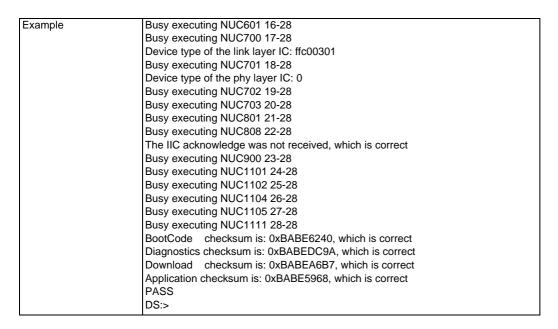

Nucleus Name	DS_IH_ScriptHandler			
Nucleus Number	Script			
Description				
Included tests:	1. DS_ANAB_COMMUNICATIONECHO_NUC			
	2. DS_DCB_COMMUNICATIONECHO_NUC

     LogDDDDD
    Scripts
9. 🗆
Select>
```

Figure 5-12

The first line indicates that the Diagnostic software has been activated and contains the version number. The next lines are the successful result of the SDRAM interconnection test and the basic SDRAM test. The last line allows the user to choose between the three possible interface forms. If pressing M has made a choice for Menu Interface, the Main Menu will appear.

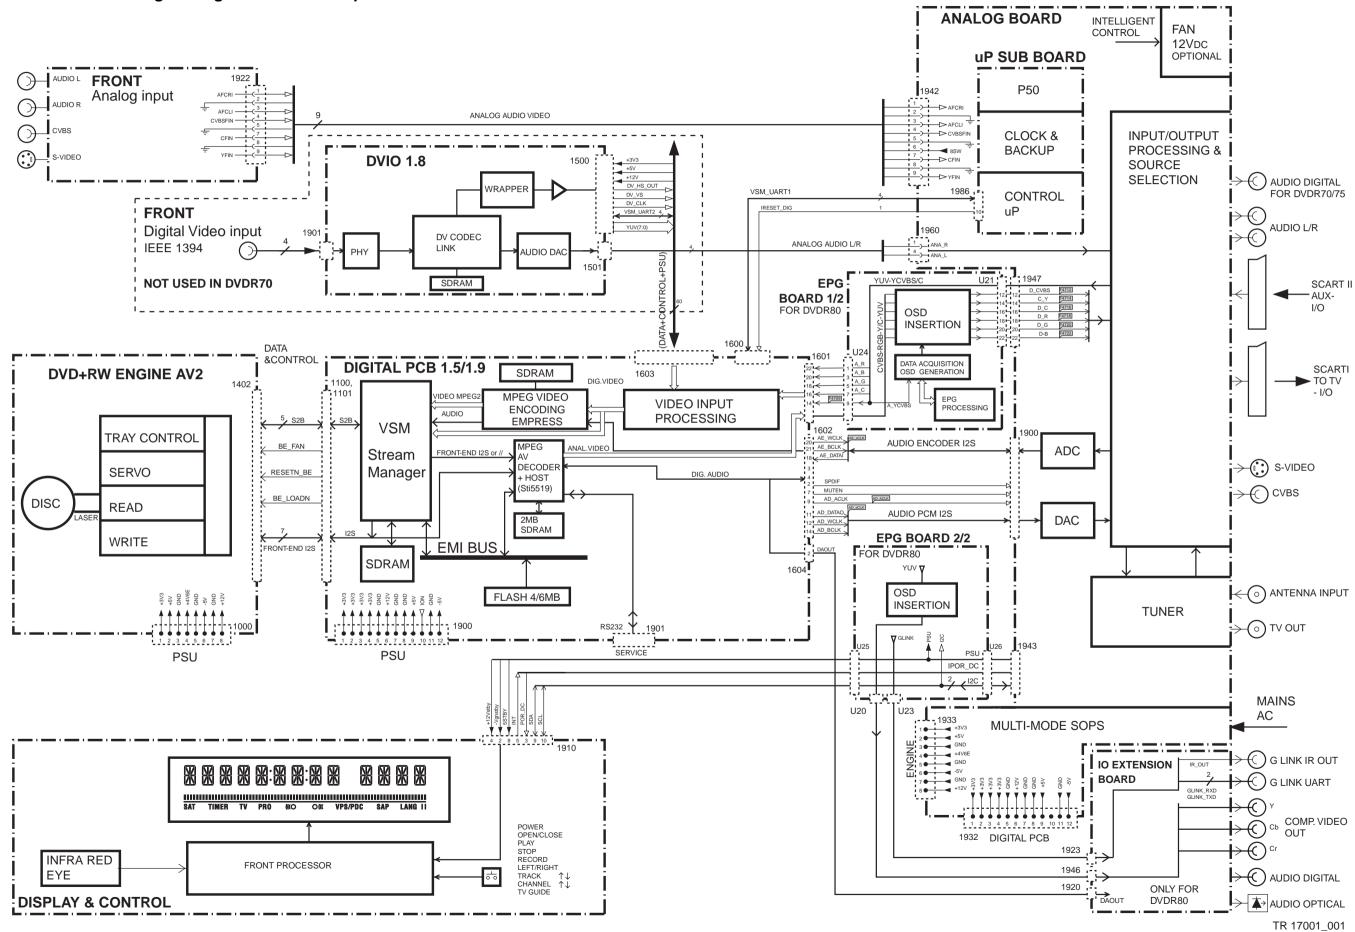

5.4 **Nuclei Error Codes**

DVIO 1.8 Error Codes

Error Code		ld	Description	Hardware
0	0x00	DVIOC_ERR_DDS_OK	No Error	
6	0x06	DVIOC_ERR_DDS_UNKNOWN	Unknown Error(including UART communication error)	
17	0x11	DVIOC_ERR_DDS_TNF_1	Link chip incorrect responding	μPD72893, Link
18	0x12	DVIOC_ERR_DDS_TNF_2	No link register access or link reset failed	μPD72893, Link
23	0x17	DVIOC_ERR_DDS_TNF_7	Link reset failed	μPD72893, Link
38	0x26	DVIOC_ERR_DDS_TNF_16	Expecting no 1394 node with GUID connectivity, while detecting connection	
39	0x27	DVIOC_ERR_DDS_TNF_17	Expecting 1394 node with GUID connectivity, while not detecting connection	
48	0x30	DVIOC_ERR_DDS_UPINTRAM A	Internal ram problem in address lines	μPD78F0988, Wrapper

8. Alignments

8.1 Alignment Instructions Analog Board

Test equipment:

1. Dual-trace oscilloscope

Voltage range : 0.001 ~ 50 V/div Frequency : DC ~ 50 MHz Probe : 10:1, 1:1

2. DVM (Digital voltmeter)

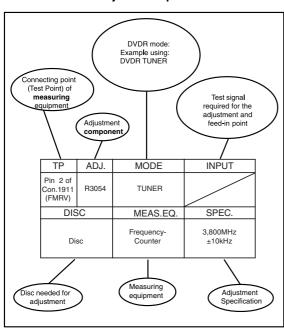

3. Frequency counter

4. Sinus generator

Sinus : 0 ~ 50 MHz

5. Test pattern generator

How to read the adjustment procedures:

Front End (FV)

Service tasks after replacement of IC 7710, coil L5710 and L5711:

1 AFC Adjustment:

Purpose: Correct adjustment of demodulator AFC - circuit Symptom, if incorrectly set:

Bad or disturbed TV channel reception.

PAL - AFC adjustment [5711]:

TP	ADJ.	MODE	INPUT
IC 7710 Pin 17 (F708)	L5711	TUNER	38,9MHz 500mV _{pp} at Tuner 1705, Pin 11 (F710, IF-out)
DISC		MEAS.EQ.	SPEC.
		DC Voltmeter Frequ. Generator	2,5V ±0,1V

Storage in NVRAM via command mode interface of DSW:

After adjustment, the AFC reference value has to be stored in the NVRAM. This reference value is 256 * measured voltage/Ucc. Ucc is 5.0V. Store the reference value via command 732 , followed by the ref. value.

Example: DD:> 732 128

2 HF - AGC adjustment [3724]:

Service tasks after replacement of IC 7710:

Purpose: Set amplifier control.

Symptom, if incorrectly set:

Picture jitter if input level is too low and picture distortion

if input level is too high.

TP	ADJ.	MODE	INPUT
Tuner 1705 Pin 11 (F710, IF-out)	R3707	Set tuned to channel 25 503.25 MHz	5mV(74dBµV) on aerial input PAL white picture, audio IF on, no modulation
DISC		MEAS.EQ.	SPEC.
		Oscilloscope Video Pattern Generator	500mV _{pp} +/-0.5dB (use a 10:1 probe)

3 Attenuating the 40.4 MHz [5710]: (SECAM only)

Service tasks after replacement of coil 5710:

Purpose: To attenuate the band I carrier rests.

Symptom, if incorrectly set:

Bad picture quality when the filter attenuates the picture carrier (38.9MHz).

TP	ADJ.	MODE	INPUT
OFW 1701 Pin 1 (F709)	L5710	TUNER	40.4 MHz, 200mV _{ms} at Tuner 1705, Pin 11 (F710, IF-out)
DISC		MEAS.EQ.	SPEC.
		Oscilloscope, Sinus Generator, Counter	adjust minimum amplitude

If the adjustment is correct the signal at pin 1 of OFW [1701] must be smaller than the input signal amplitude by at least 6 dB.

8.

Reprogramming Procedure of NVM on the 8.2 **Microprocessor Sub PCB**

The NVM, item 7808, on the Microprocessor Sub board contains the following factory settings:

- 1. Clock correction factor
- 2. AFC reference value
- 3. Slash version

The settings 1,2 and 3 are stored in the NVM during the production of the analogue board.

The slash version is stored at the end of the production line of the set.

In case of failure, the NVM must be replaced by an empty device. By way of commands via the Diagnostic Software or via ComPair, the factory settings must be restored in the NVM.

8.2.1 **Clock Correction Adjustment**

To guarantee an exact function of the real time clock, an adjustment of the clock frequency is possibe. The adjustment value is stored in the NVM.

Procedure:

- put the set in service command mode
- execute command 722 for Digital Board 1.5 Empress or 1117 for Chrysalis to initiate that a signal with 32768 Hz is available on pin 3 of connector 1988 example:

DD:>722 or DD:>1117

- measure the frequency fmeas of the Clock Crystal with an accuracy of 0.1 Hz.
- Calculate the parameter to be entered: 32768/fmeas * 106
- Normally the parameter must be between 999902 and 1000097. If the parameter and therefore the frequency of the crystal is outside this range, the crystal must be replaced.
- Execute command 721 for Empress or 1118 for Chrysalis with the parameter as input example:

DD:>721 1000023 (Empress) or DD:>1118 1000023 (Chrysalis)

8.2.2 AFC Reference Voltage Tuner

This function stores the reference voltage for the tuner in the NVM. Before this value can be stored, the AFC adjustment, described in the adjustment instructions of the analogue board, must be carried out.

Procedure:

- Adjust AFC circuit
- Calculate the reference value
- Execute command 732 for Empress or 1119 for Chrysalis and use the calculated reference value as parameter example: DD:>732 128 (Empress) or DD:>1119 128 (Chrysalis)

8.2.3 Slash Version

The slash version is stored with command 715 for Empress or 1217 for Chrysalis, followed by the slash version as parameter. The slash versions used in DVDR75 and DVDR80 are the following:

DVDR80/00x/02x: SV 65 DVDR80/05x: SV 66 DVDR75/00x/02x: SV 67 DVDR75/05x: SV 68 DVDR70/00x/02x: SV 69 DVDR70/05x: SV 70

Example:

DD:>715 65 (Empress) or DD:>1217 65 (Chrysalis)

Reset of Slash Version

Use command 729 for Empress or 1115 for Chrysalis to reset the analogue board to the default setting.

Procedure:

- Put the set in DSW command mode
- Execute command 729 (Empress) or 1115 (Chrysalis) with the following parameters:

DD:> 729 w 0xAE 2 0xD0 0x00 (Empress) DD:> 1115 w 0xAE 2 0xD0 0x00 (Chrysalis)

Leave the DSW command mode and start up the set in application mode

No background is visible on the TV screen. The analogue board is ready to accept the appropriate slash version

8.3 **Rework Procedure IEEE Unique Number**

8.3.1 Scope:

The procedure describes how to upgrade sets with a unique number after repair. This unique number is stored in the NVRAM (item 7201) of the digital board at the end of the production line.

This procedure is only valid or necessary when:

- The digital board is replaced
- NVRAM on the digital board is replaced
- NVRAM is cleared

In all other cases the repaired set retains its unique number. The procedure defines several means to re-assure the unique number depending on the possibilities of repair or the state the faulty set is in.

8.3.2 Handling:

State of original (defective) board:

- 1. The digital board starts up in Diagnostics Mode: follow procedure A to retrieve the valid unique number
- 2. The digital board does NOT start up in Diagnostics Mode: follow procedure B.

8.3.3 Procedure A

- 1. Connect defective digital board to PC via serial cable (3122
- 2. start up hyper terminal or any other serial terminal via the correct settings (DSW command mode interface)
- 3. read out existing unique number via nucleus 403 (Empress) or 1208 (Chrysalis)

DD:> 403 40300: DV Unique ID = 00D7A1FC6C Test OK

- 4. note read out
- program new digital board via nucleus 410 (Empress) or 1207 (Chrysalis) example:

DD:> 410 00D7A1FC6C 41000: Test OK @

The set has now the original unique number

8.3.4 Procedure B

- 1. Note the serial number of the set example: VN050136130156
 - VN = production centre (VN....Szekesfehervar). According to UAW-500: V=22 and N=14
 - 05 = change code (this is not used for this calculation)
 - 01 = YEAR
 - 36 = Production WEEK
 - 130156 = Lot and SERIAL number
- 2. Calculate the unique number: this number always exists out of 10 hexadecimal numbers.
- 3. First 5 numbers: First we calculate a decimal number according to the formula below:35828*YEAR + 676* WEEK + 26*A + H + 8788 The figures are fixed, YEAR + WEEK + factory code (A + H) are variable Example: 35828*01+676*36+26*1+8+8788 = 68986 (decimal) Then we translate the decimal number to a hexadecimal number. example: 68986 (decimal)= 10D7A (hex)
- 4. Last 5 numbers: The last 5 numbers exist out of the Lot and SFRIAL number.
 - We have to translate the decimal number to the next 5 hexadecimal numbers: Example: 130156 (decimal) = 1FC6C (hex)
- 5. Program new digital board via nucleus 410 (Empress) or 1207 (Chrysalis). Therefore we use the 10 hexadecimal numbers we calculated above: example:

DD:> 410 10D7A1FC6C or DD:>1207 10D7A1FC6C 41000: Test OK @

The set has now its original unique number

8.4 **Adjustment DVIO 1.8 PCB**

This adjustment sets the free running frequency of the VCO of the audio PLL. It should be carried out after replacement of IC 7604.

- 1. Disconnect DVD+RW set from the mains.
- 2. Plug DVIO1.8 board via edge-connector onto Digital Board (DVIO board is vertically oriented, so that both sides of the PCB are accessible for measurements).
- 3. Connect DVD+RW set to the mains.
- 4. Turn DVD+RW set on and select any video input source except the DV input.
- 5. Check the signal at test point F611 with an oscilloscope. The signal should be 5V digital with 50% duty-cycle.
- 6. Measure the frequency of the signal at test point F610 and adjust the potentiometer 3605 to get a frequency of 12.288MHz 50kHz (after removing the screwdriver from the potentiometer).
 - In case the frequency can not be increased sufficiently, replace capacitor 2618 by NP0-type capacitor with 18pF. Adjust afterwards again the frequency with the potentiometer.
 - In case the frequency can not be decreased sufficiently, add (3pF-10pF) trim-capacitor in parallel to capacitor 2618 or replace capacitor 2618 by NP0-type capacitor with 27pF.Adjust afterwards again the frequency with the potentiometer (and/or trimcapacitor).
- 7. Switch DVD+RW set to Stand-by mode.
- 8. Disconnect the DVD+RW set from the mains.
- 9. Plug DVIO1.8 board directly (without edge connector) onto Digital Board.
- 10. Connect DVD+RW set to the mains.
- 11. Connect a DV-source that transmits DV-video data with audio to the DVD+RW set.
- 12. Turn DVD+RW set on, select DV input, and switch DVD+RW set appropriately to output the decoded signal. Audio should be output without distortion.

8.5 Alignments after replacing the Boot EEPROM 7810 in sets with Digital Board Chrysalis

The NVM, item 7810, on the Digitalt Board Chrysalis contains the "Diversity String" that tells the software during startup which hardware version is present.

The setting is stored in the NVM during the production of the Digital Board Chrysalis

In case of a fault the NVM must be replaced by a programmed device containing the boot script.

Via the Diagnostic Software the Diversity String is stored with command 1226, followed by the Diversity String as parameter.

The diversity strings used in DVDR70/0x1 and DVDR75/0x1 are the following:

Chrysalis String **Board** Type

With command 1228 the settings can be displayed.

Circuit-, IC descriptions and list of abbreviations

9.1 **Display Board**

9.1.1 Microcontroller

The core element of the Display Control unit is the microcontroller TMP87CH74AF [7110]. The TMP87CH74AF is an 8 bit microcontroller fitted with 32kB ROM and 1kB RAM. It requires 5V supply and is responsible for the following functions:

- Interface to Central Controller-P
- Evaluation of the keyboard matrix
- Decoding the remote control commands from the infra-red
- Activation and control of the local display
- Heater voltage generation

The 8 MHz resonator (Pos. 1111) generates the system clock. The reset is generated by the CC-P via "POR_DC"-signal where the transistor [7106] is used as a level-shifter from 3V3 to 5V.

9.1.2 Interface to the Central Control μP

The communication to the main microcontroller (CC) on the P-Sub-PCB is done via I2C-Interface, where the TMP87CH74AF acts in slave-mode.

An additional wire ("INT"-line) is used to signal the Central controller that data are ready, e.g. when a key has been

Evaluation of the keyboard matrix

There are 12 different keys on the display board. A resistor network is used to generate a specific direct voltage value, depending on the pressed key. Via the resistors 3107 and 3102 on the analog/digital (A/D) ports (7103 pin 37 and 38) the evaluation is done.

IR receiver and signal evaluation

The IR receiver [7107] contains a selectively controlled amplifier as well as a photo-diode. The photo-diode changes the received infra red transmission (approx. 940nm) to electrical pulses, which are then amplified and demodulated. On the output of the IR receiver [7107], a pulse sequence with TTL-level, which corresponds to the envelope curve of the received IR remote control command, can be measured. This pulse sequence is fed into the controller for further processing via port TC1 [7103, pin20].

Vacuum Fluorescence Display

The VFD "BJ900GNK" [POS 7100] is fully controlled by the microcontroller. The µC also includes the driving stages. Only two additional drivers [POS 7101 and 7102] are necessary for the grids 8 and 9 because of their large size.

9.1.6 VFD Heater Voltage Generator

The circuit around POS [7106, 7108 and 7109] is used to generate a proper AC-Voltage for the filament of the VFD. For this the microcontroller generates an appropriate rectangular signal with 50% duty-cycle and a frequency of 30 kHz at pin 19. Pos. [5104] and [2113] are acting as a resonance-circuit. Via Zener-Diode (POS[6100]) and resistors [3119, 3122 and 3123] the two heater-pins of the VFD ("FIL1" and "FIL2") are clamped so that the grids and segments can be fully switched off.

REC-LED 9.1.7

The REC-LED-ring is made with 3 red LED, controlled via pin 3 (only for flashing) and pin 12 for on/off switching, of the microcontroller. The POS [7105] is used as a driver for the led.

9.1.8 **EPG-LED**

The EPG led is a white led and controlled from the pin 14 from the microcontroller. The POS [7110] is used as a driver for the

9.1.9 TRAY-LED

There are 6 leds (chip) necessary to illuminate the tray, these 6 leds are located on a little sub-pcb connected over a 4 pin connector POS [1911] from the DC-print. The leds are controlled from pin 11 of the microcontroller.

9.2 Microcontroller Sub Board (UP SUB Board)

9.2.1 General

This small PCB is directly soldered in on top of the Analogue-

It is used with no diversity in all three different basic versions (Europe, NAFTA and APAC-Pal). Only the software being loaded into the external Flash-memory is not the same.

9.2.2 Microcontroller

The main part of the Sub-PCB is the central controller (CC) μP [7804] TMP91CW12AF, which is a 16-bit CPU with 128kBROM and 4kB RAM.

It works with a 3V3 supply and a system clock of 24,576MHz

The 3V3-supply is made out of the "5VSTBY" by the circuit

After connecting the set to the mains (power-up) the IC [7806] generates a reset pulse. This signal ("IPOR") is directly fed to first priority interrupt input (pin 63) for power fail detection and also to the Reset-Input of the CC (Pin30) via [7802], which is necessary to generate a reset only during power-up. In case of power fail pin 30 of the CC must be kept high (3V3).

The internal memory of the CC is too small for all necessary demands. Therefore an external Flash-ROM [7805] with 1MByte in size and a RAM [7803] with 128kByte are necessary. Both parts are connected to the μP via a parallel address-/data-bus. The lower eight bus-lines (AD0 to AD7) are multiplexed by [7801] and the "ALE"-signal of the CC. For updating of the software the external Flash-ROM can be reprogrammed by the μP . During this process [7807] is switched on by the "WE"-signal.

When no mains is connected, the CC is supplied via Gold-Cap [2816] during the power backup period. The diode [6802] prevents unwanted current consumption of other components. The internal ROM of the μP holds the program code for the Real-Time-Clock. Only the microprocessor is supplied by the backup cell, not the external memories and the μP operates in a low frequency mode with the clock crystal [1805] only (32.768 kHz). To adjust the clock the frequency can be measured at pin 87 of the μP in a special test-mode.

9.2.3 **Control-Interfaces**

The CC is communicating with the digital board via a serial connection, which operates at a speed of 19,4 kbit/s ("D_DATA"-, "A_DATA", "D_RDY"- and "A_RDY"-signal on [1986]). By generating a high level on pin 16 of the CC the digital PCB can be reset (inverter [7817] in between). Most of the other parts are controlled by the μP via I2C-bus ("SDA"- and "SCL"-signal). The FETs [7821] and [7822] are used for adaptation of the 3V3-level on CC-side to the components supplied with 5V.

The CC can also reset the display-board- μP by pulling pin 39 to high.

The transistor [7819] acts as a level shifter for the "INT"-signal. In the European sets a bi-directional interface is established between the recording unit and the TV device at pin 10 of the Scart ("P50"-line/Easy Link). The processing is done via pin 14 (output) and pin 38 (input) of the CC and the circuit around [7813], [7814] and [7815].

9.2.4 **EEPROM**

The EEPROM M24C16 [7808] is an electrical erasable and programmable, non-volatile memory. The EEPROM stores data specific to the device, such as the AFC-reference value of the Europe IF-part, the clock-correction-factor, etc. It is accessed by the μP via the I2C-bus.

9.2.5 Sync Separator

To detect whether a video signal is available or not a separate IC [7825] is used to extract the sync information out of the video signal that is also routed to the digital board for recording. While on the input a low-pass-filter ([2823] and [3869]) limits the bandwidth an additional filter (circuit around [7818]) on the output avoids distortions. Afterwards the sync-signal is routed to pin11 of the CC.

9.2.6 Fan Control

To avoid unwanted temperatures inside the set (especially the Laser on the OPU of the drive is very sensitive) a fan is located on top of the basic engine. The speed control is dependent on the ambient temp. A NTC resistor [3134] located on the display board measures the temperature. An operational amplifier [7902-B] generates a proper voltage, which is then fed to the engine ("BE_FAN"-line). Below 28°C ambient temp. the fanvoltage is approx. 5V and is increased to 10V when the ambient temperature goes up to approx. 38°C. The second part of the Op-Amp. [7902-A] prevents damage of any temperaturesensitive part in case the NTC or the wire in between is damaged. It acts as a comparator and pulls the "BE_FAN"signal to 10V. As the fan has to be stopped in case the tray of the drive is open this voltage is "killed" by the CC ("FAN_OFF"signal). The double-diode [6901] acts for both Op.-Amp.circuits. The circuit is also prepared for a set-fan (circuit around the Op-Amp. [7902-C]).

9.3 Analog board Europe

9.3.1 General

This PCB consists out of the following parts:

- Power-Supply-Unit
- Frontend (Audio & Video)
- Input-/Output-switching
- Audio ADC- & DAC-processing
- VPS/PDC- and Text-Data slicer
- Analog Follow-Me Circuit

All functional groups are either controlled via I2C-bus or via separate signal lines by the Central-Controller on the $\mu P\text{-}Sub\text{-}Board$. This sub board is directly soldered in onto the analog PCB. During Stand-By mode of the set, several parts are not supplied (Tuner, MSP, ...). The microprocessor is running and maintains the clock of the set.

To avoid bus blockades the I2C-bus ("SCLSW" & "SDASW") to/from these units is decoupled via transistors [7419], [7420] from the general bus ("SCL" & "SDA").

9.3.2 Power Supply Unit

Functional principle:

This power supply works in the way of a flyback converter. In the mains input part [1931 to 2309], the mains voltage is rectified and buffered in the capacitor [2309]. From this direct voltage at [2309] energy is transferred into the transformer [5300, pins 7-5] during the conductive phase of the switching transistor [7307] and is stored there as magnetic energy. This energy is passed to the secondary outputs of the power supply in the blocking phase of the switching transistor [7307]. With the switch-on time of the switching transistor [7307], the energy transferred in every cycle is regulated in such a way that the output voltages remain constant regardless of changes in the load or mains voltage. The power transistor is driven by the integrated circuit [7313].

Mains input part:

The mains input part extends from the mains socket [1931] to the capacitor [2309]. The diodes [6301, 6302, 6305 and 6306] rectify the AC supply voltage, which is then buffered by the capacitor [2309]. The common mode coil [5302] and capacitor [2302] work as a filter to block interference arising in the power supply from the mains. Components [1302], [3306] and [3304] protect the power supply against short-term over voltages in the mains, e.g. caused by indirect lightning.

Start-up with Mains-on:

After connecting the power cord to the mains, the capacitor [2325] is loaded via a current source between pin 8 and pin 1 in the IC [7313]. Once the voltage on [2325] and therefore the supply voltage Vcc of the IC [7313] has reached approx. 11V, the IC starts up and provides pulses at its output pin 5. These pulses are used to drive the gate of the power transistor [7307]. The frequency of these pulses is depending on load and mains voltage. The current consumption of the IC is approx. 5 mA at Vcc in normal mode.

If Vcc drops to below approx. 9V (e.g. with power limitation) or if Vac exceeds approximately 16V (e.g. interruption of the control loop), the output of the IC [7313, pin 5] is blocked and a new start-up cycle begins. (See also "Overload, Power Limitation, Burst Mode" section)

Normal operation:

With the power supply in normal mode, the periodic sequences in the circuit are divided primarily into the conductive and blocking phase of the switching transistor [7307]. During the conductive phase of the switching transistor [7307], current flows from the rectified mains voltage at capacitor [2309] through the primary coil of the transformer [5300, pins 7-5], the transistor [7307] and resistors [3321, 3352] to ground. The positive voltage on pin 7 of the transformer [5300] can be assumed as constant for a switching cycle. The current in the primary coil of the transformer [5300] increases linearly. A magnetic field representing a certain value of the primary current is formed inside the transformer. In this phase, the voltages on the secondary coils are polarized such that the diodes [6300, 6303, 6307, 6308, 6310, 6313, 6317 and 6319] block. From the controller [7315] a current is supplied into the CTRL input on the IC [pin 3, 7313] via optocoupler [7314]. Once the switch on time of the switching transistor [7307] - that corresponds to the current supplied into the CTRL input - has been reached, the switching transistor [7307] is switched off. When the switching transistor has been switched off, the blocking phase begins. No more energy will be transferred into the transformer. The inductivity of the transformer will still attempt to keep the current flowing at a constant level (U=L*di/ dt). Switching off transistor [7307] interrupts the primary current circuit. The polarity of the voltages on the transformer is reversed, which means that the diodes [6300, 6303, 6307, 6308, 6310, 6313, 6317 and 6319] become conductive and current flows into the capacitors [2305, 2312, 2319, 2322, 2326 and 2328] and the load. This current is also ramp-shaped (di/dt negative, therefore decreasing).

The feedback control for the switched-mode power supply is done by changing the conductive phase of the switching transistor so that either more or less energy is transferred from the rectified mains voltage at [2309] into the transformer. The regulation information is provided by voltage reference [7315]. This element compares the 5V-output voltage via voltage divider [3332, 3333, 3334] with an internal 2.5V reference voltage. The output voltage of [7315] passes via an optocoupler [7314] for insulation of primary and secondary parts as a current value into pin 3 on the IC [7313]. The switchon time of the transistor [7307] is inversely proportional to the value of this current.

Overload, power limitation, burst mode:

With increasing load on one or more of the power supply outputs, the switch-on time for the power transistor [7307] increases, and thus also the peak value of the delta-shaped current through this power transistor. The equivalent voltage of this current profile is passed from resistors [3321] and [3352] via [3365] to pin 5 of the IC [7313]. If the voltage on pin 2 reaches approx. 0.4V in one switching cycle, the conductive phase of the switching transistor is ended immediately. The check is done in each individual switching cycle. This process ensures that no more than approx. 60W can be taken out from the mains (= power limitation).

If the power supply reaches the power limit, the output voltages and the supply voltage Vcc on pin 1 of the IC [7313] will be reduced following further loading. If Vcc is less than approx. 9V at any point during this process, the output of the IC [7313, pin 6] is blocked. All output voltages and Vcc decrease and a new start-up cycle begins. If the overload status or short-circuit remains, the power limitation will be activated immediately and the voltages will again decrease, followed by another start-up cycle (Burst Mode). The amount of power taken up from the mains in burst mode is low.

Standby modes:

In the 'AV-Standby' operating mode of the set, the 'ION' control line is primarily used to switch off all output voltages for Basic Engine and Digital Board (supplies 3V3, 5V, 12V, 5N and 4V6 at Connectors 1932 and 1933) of the power supply. This reduces the amount of power taken from the mains. In Low Power Standby mode additionally the 'STBY' control line is used to switch off output voltages 5SW and 8SW. This reduces power consumption to less than 3W, if additionally the display is switched off. The power supply will continue operating in Standby mode with a switching frequency of approx. 25 kHz.

Frontend 9.3.3

This unit is designed to support two basic versions, which are distinguished by a different assembly variant only (one for multistandard and the second for Pal-I only) and comprises the

- Tuner UV1316K [1705]
- IF amplifier & video demodulator IC TDA 9818/9817 [7710]
- Sound processor MSP3415G [7600]

Tuner and IF selection

The Tuner [1705] converts the RF-signal coming from the antenna input to an IF-signal. The tuner is fully controlled via I²C-bus of the CC-μP. [1705] is also equipped with a "passiveloop-through" between antenna-in and -out to save power in stand-by of the set, when the complete part is not supplied. The IF frequency of the video carrier is 38.9 MHz for all systems except SECAM L' (34,0 MHz).

A quasi-split audio system is used. Separate surface-wave filters (SAW) are required. [1701], [1703] for video, [1702] for audio. [1701] is switched into the signal path for DK/I-SECAM L/L' reception, if the signal "SFS_TS" is "high". In this case the switches [7704], [7705] are open and the diode [6703] is conducting. [1703] is switched into the signal path for BG reception ("SFS TS" is "low"). Then the switch [7712] is open and the diode [6704] is conducting. For DK/I-SECAM L/L'

reception, an additional circuit for suppressing the audio carrier of the adjacent channel is used. This circuitry is adjusted by coil [5710] for maximum suppression at 40.4MHz.

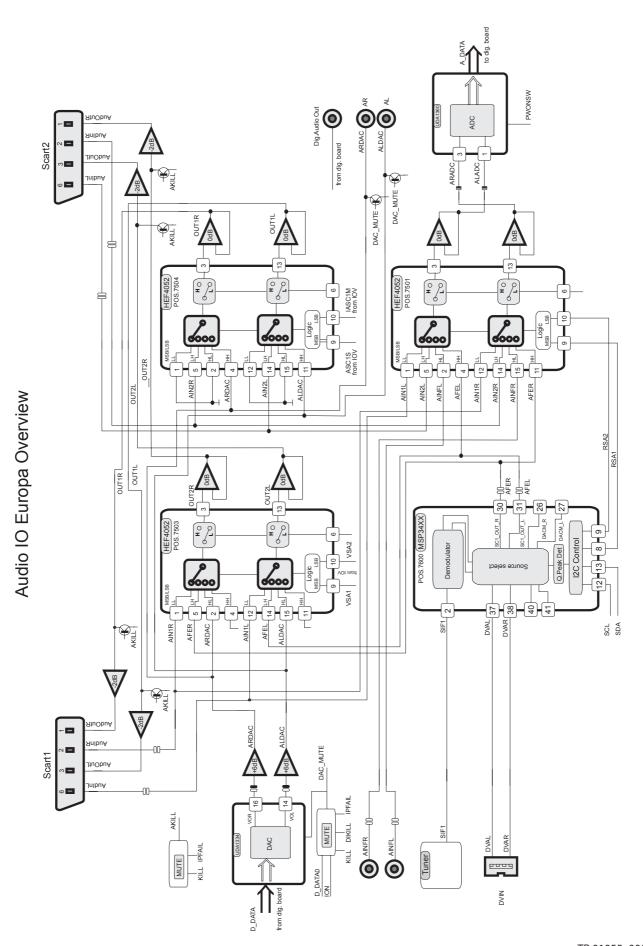

IF demodulator

The signal from the tuner and IF-selection circuit is processed by the demodulator IC TDA 9818/9817 [7710]. The signal "PSS" to pin 3 switches between demodulation of positive (SECAM only) or negative modulated video carriers. A QSSaudio-IF signal SIF1 is generated for demodulation in the sound processor [7600]. The audio-IF carrier is selected in the audio SAW filter [1702]. This filter is switched for SECAM L'. If the signal "SB1" is "high", the switch [7714] is closed and the diode [6705] is not conducting. For all other standards the diode [6705] is conducting and the switch [7714] is open. The output signal of this SAW filter is firstly processed in the TDA 9818. Audio carriers are converted from the tuner IF level to the audio IF position and further processed in the audio demodulator [7600]. The AFC coil [5711] on the TDA 9818/ 9817 is adjusted so that when a frequency of 38.90 MHz is supplied to the IF output of the tuner, the AFC voltage on pin 17 of [7710] is 2.5V. The setting of the picture carrier frequency for SECAM L in the TDA 9818 is achieved by connecting pin 7 of the IC via a resistor [3710] to ground. The switch [7701] and the signal "SB1" do this. The HF-AGC is set using the potentiometer [3724] so that, with a sufficiently large antenna input signal (74 dB μ V), the voltage at the IF output of the tuner [1705] pin 11 is 500 mVpp. This setting must be carried out when the audio carrier is switched off. The demodulated video signal appears on pin 16 of [7710]. The AGC voltage at pin 4 is used to determine the antenna signal strength after a buffer [7717] with the signal "AGC" and an analog input port of the CC-P. The trap [1704] reduces the sound carrier remainders in the video for BG standards. The trap [1706] works in the same way for the Pal-I standard only. For all other standards the switch [7713] is closed via [7706] and "SFS_TS"-line set "high" to bypass this trap. In these cases the selectivity of the SAW filter [1701] is sufficient. The coil [5713] for non-BG standards realizes a frequency response correction. This correction is not desired for SECAM L' and therefore short-circuited by [7716] (signal SB1 is "high" and [7702] has on-status). The demodulated video signal "VFV" is available after the buffer and limiting stage for noise peaks [7711]. The FM-PLL demodulator function of TDA 9818 is not necessary and therefore deactivated by the resistor [3739].

Audio demodulator

The sound demodulation is done by the MSP3415 [7600], which is also fully controlled via I²C-bus by the CC-P (determination of bandwidth, amplitude, standard, ...). The audio signals are available at pin 30 and pin 31 of [7600] and fed as "AFER"- & "AFEL"-line to the audio-I/O for further processing.

9.3.4 Audio routing

The processing of audio is always done in stereo (e.g. separate left- and right-channel) and the complete switching is realized by using HEF4052, which is a dual four-to-one multiplexer. In principle there are three independent selectors:

a) Scart 1-Output-Path:

Pos [7504] is used to select either Scart 2-Input ("AIN2L"/ "AIN2R") or the signal directly from the audio DAC [7004] ("ALDAC"/"ARDAC") as the output source for Scart 1 ("AOUT1L"/"AOUT1R").

The control is done by means of the lines "ASC1S" coming from [7408] (IC [7408] acts as a port expander for the CC-P) and "IASC1M", which is directly coming from the CC. Pos [7412] is used for level adaptation (3V3 to 5V) for the "IASC1M"-signal.

b) Scart 2-Output-Path:

Pos [7503] selects between Scart 1-Input ("AIN1L"/"AIN1R"), signals from the internal frontend ("AFEL"/"AFER") via MSP [7600] or audio directly from the DAC [7004] ("ALDAC"/ "ARDAC"). The outputs of this switch are routed to Scart 2 ("AOUT2L"/AOUT2R"). This switch is controlled via "VSA1"and "VSA2"-line. These lines come from [7408] that is acting as a port expander for the CC-P.

c) Record-Path:

Pos [7501] selects either signals from Scart 1 ("AIN1L"/ "AIN1R") or Scart 2 ("AIN2L"/"AIN2R") or Cinch-Front ("AINFL"/ "AINFR") or the MSP [7600] ("AFEL"/"AFER") and routes to the audio ADC [7007] ("ALADC"/"ARADC") for record purposes. The switch is controlled via "RSA1"- and "RSA2"-signals. These signals come from the MSP [7600], which acts as a port expander of the CC-P. As there can also exist a fifth input in case of DV-In is present the corresponding analog audio signals from the DVIO-board are firstly routed via extra cable and connector [1960] to the MSP. The MSP acts as a preselector between audio from internal frontend or the DV-

Each of these three selectors ([7501], [7503] & [7504]) has a separate Op-Amp on the output for level-adaptation-, performance- and line-driving-reasons. [7505-A & -B] for record, [7502-C & -D] for Scart 1-Output and [7502-A & -B] respectively for Scart 2. Every audio output line on the two Scart connectors can be "killed" (muted) by an extra transistors ([7506], [7508], [7509] & [7511]), which can be activated by the "AKILL"-line. This signal is generated by the circuit around [7404]/[7421] and is a combination of the "KILL"- from the CC-P and the "IPFAIL" of the power-supply-unit.

d) Line-Out-Path: see chapter 9.3.5

ground.

e) Digital Audio Output-Path without IOE-Print: Additionally to analog audio the set is also equipped with a digital output via cinch plug [1951]. The signal is generated on the dig. board and routed via audio interface cable and connector [1900] to the Ana-PCB. Here the "DAOUT"-line first passes a 6-fold inverter [7580] being used as a driver and for performance reasons (noise reduction, jitter, etc.). Afterwards a transformer [5580] is necessary to achieve the correct level and also to have a floating output with isolated ground before the signal is fed via [3580] to cinch plug [1951]. The capacitor [2580] performs an AC-coupling between connector- and set-

f) Digital Audio Output-Path with IOE-Print: In case of usage of the IOE-print the digital audio signals (input and output) are directly routed from digital board via interface cable to plug [1920] on the IOE-print. The "DAOUT"-line is splitted into two signals, one for cinch out and one for optical out. The signal to cinch out first passes a 5-fold inverter [7250] being used as a driver and for performance reasons (noise reduction, jitter, etc.). Afterwards a transformer [5250] is necessary to achieve the correct level and also to have a floating output with isolated ground before the signal is fed via [3259] to the cinch plug [1925] (or [1926-B] in case of option

"DIGITAL IN"). The capacitors [2256] and [2266] perform an AC-coupling between connector- and set-ground. The second "DAOUT"-signal is fed directly via [3264] to the optical out transmitter [6255].

g) Digital Audio Input-Path with IOE-Print:

There are two possibilities for a digital audio input signal in case of option "DIGITAL IN". One is the signal from the optical receiver [6259], which is routed via [3269] directly to plug [1920]. The second is the signal from the cinch plug [1926-A]. This signal then passes an inverting amplifier [7250-6] and is then routed via [2253] to the plug [1920].

Audio ADC/DAC 9.3.5

a) PCBs with AD1852 [7004]:

The conversion of analog audio signals from the recordselector [7501] in the I/O ("ALADC"- & "ARADC") is done via UDA1361TS [7007]. This IC can process input signals up to 2Vrms by using external resistors [3047], [3053] in series to the input pins. As the level from the DVIO-Board is only 1Vrms a 6dB step can be performed by setting pin 7 of [7007] to 3.3V via [7008] and the "PWONSW"-line controlled by the CC-P to use the whole dynamic range of the ADC. All required clock signals are generated on the dig. board and only the audio data ("A_DAT"-line) are routed from Ana- to Dig.-PCB for further

The transformation of dig. audio back into the analog domain is done by AD1852 [7004]. All necessary clock signals are coming from the dig. board and dig. audio data ("D_DATA0"line) are converted into analog signals, which are available at pin 17/16 and pin 12/13 of [7004] as symmetrical signals. Afterwards an Op-Amp. [7003] (line driver & converting to unsymmetrical signal, gain = 1), which is also working as lowpass-filter to increase signal performance (noise, distortions,...), is passed. Then both signals ("ALDAC" & "ARDAC") are directly routed to the rear cinch output and also used in the audio-I/O for further processing. The DAC has also a mute possibility, which can be activated by setting pin 23 to 5V via [7001]. This mute is controlled either by the dig. board ("D_IKLL"-line) or the "IPFAIL"-signal from power-supply-unit (in this case it's the combination of "A_KILL" and "IPFAIL"). If the DAC is muted externally via pin 23 or if there are no audio data available (e.g. "D_DATA0"-line zero), the output pins 8 and 22 of the DAC change to high (+ 5V). These two signals are then combined with diode pos. 6006. After decoupling via [7009] the signal "DAC_MUTE" is used as mute signal for the mute transistors [7415], [7416] for cinch rear out.

b) PCBs with UDA1334BTS [7001]:

The conversion of analog audio signals from the recordselector [7501] in the I/O ("ALADC"- & "ARADC") is done via UDA1361TS [7005]. This IC can process input signals up to 2Vrms by using external resistors [3039], [3041] in series to the input pins. As the level from the DVIO-Board is only 1Vrms a 6dB step can be performed by setting pin 7 of [7005] to 3,3V via [7006] and the "PWONSW"-line controlled by the CC-P to use the whole dynamic range of the ADC. All required clock signals are generated on the dig. board and only the audio data ("A_DAT"-line) are routed from Ana- to Dig.-PCB for further processing.

The transformation of dig. audio back into the analog domain is done by UDA1334BTS [7001]. All necessary clock signals are coming from the dig. board and dig. audio data ("D_DATA0"line) are converted into analog signals, which are available at pin 14 and pin 16 of [7001]. Afterwards an Op-Amp. [7002] (line driver & level adaptation, gain = 2) which is also working as low-pass-filter to increase signal performance (noise, distortions,...), is passed. Then both signals ("ALDAC" & "ARDAC") are directly routed to the rear cinch output and also used in the audio-I/O for further processing. The DAC has also a mute possibility, which can be activated by setting pin 8 to 3,3V via [7003]. This mute is controlled either by the dig. board

("D_IKLL"-line) or the "IPFAIL"-signal from power-supply-unit (in this case it's the combination of "A_KILL" and "IPFAIL"). In addition to that the DAC [7001] and the cinch outputs can be killed (muted) in case of "digital silence" by the circuit around [7008], [7009] and [7010], when no audio data are available (e.g. "D_DATA0"-line zero).

This function can be also activated via the "ION"-line (set to high during any stand-by mode). To avoid signal distortions (clipping) the mute transistors for cinch rear out [7415], [7416] are decoupled via [7011].

9.3.6

DVDR70 & DVDR75/0x1

Video-routing

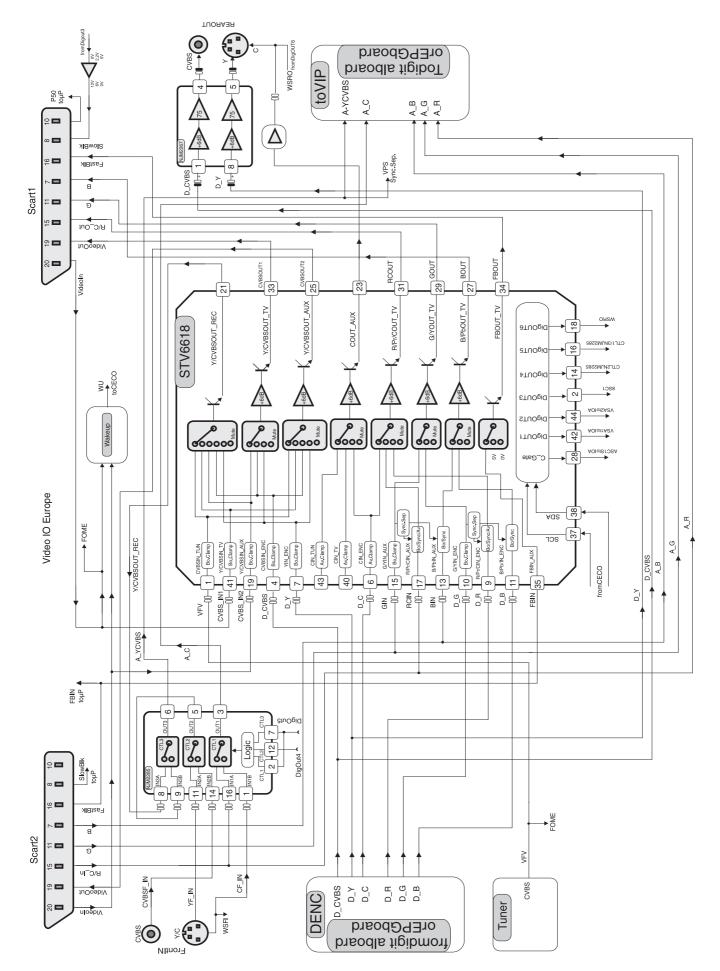

Figure 9-1

The Video-I/O-switching is basically realized by the matrix switch STV6618 [7408], which is controlled via I²C-bus by the CC. All used outputs excluding pin 21 (Y/CVBS-REC) have a 6 dB-amplification and a 75 Ohms driver-stage inside. This IC includes also several digital outputs, which are used for switching purposes on the analog board. The record selector inside the switch selects between the CVBS from frontend ("VFV"), the input from Scart 1 ("YCVBSIN1") or the signal from Scart 2 ("YCVBSIN2"). Afterwards the signal passes another switch [7411] in which a selection between signals from the front or the preselected ones are done. The output signals of [7411] are fed as "A_YCVBS"- and "A_C"-line to the digital board for further processing.

To reduce the number of external presets there exists only one preset for CVBS- and Y/C-front. The set automatically detects between the two inputs depending on the presence of a video signal (sync separator-circuit on μP-sub-board) where Y/C has higher priority.

The R/G/B-inputs and the Fast-Blanking-line from Scart 2 are routed over the optional EPG board to the digital PCB. Also all other video signal from the analog board are routed through the EPG board if present. These signals are also available on the corresponding input-pins of the STV6618 to enable a loopthrough in AV-Standby. In this mode the set has to behave like a cable between the two Scart-connectors. AV-Standby is activated either by a "high" level on pin 8 of Scart 2 ("active device is present") or by the "WU"-line (wake up). This signal is generated out of the circuit around [7401], [7402] & [7403] and will become "high" if there is a signal on pin 20 of Scart 1- or Scart 2. The detection of the input level on pin 8 of Scart 2 ("8SC2") is done via an analog input of the CC-P (less than 2V means inactive; 4,5V to 7V determines a source with 16:9 picture-ratio and greater than 9,5V is an active 4:3 source). All signals from the digital board ("D_R", "D_G", "D_B", D_C", "D_Y" and "D_CVBS" are routed to the proper inputs of the STV6618 for amplification and driving purpose before they can be seen on the appropriate Scart outputs. In case of EPG the signals from the digital board are routed through the EPG board where the selection between digital board video or EPG OSD is taken.

The "D_CVBS"- and the "D_Y"-line are passing a 6 dBamplifier and driver-IC [7410] and are then routed to the CVBS-Cinch and Y/C-out rear. The chroma signal for this Y/C out is coming from the STV6618 - which makes the 6 dBamplification - and a driver [7406] in between.

The detection of the picture ratio information on the Y/C-input front is made by measuring the DC-level on the Chroma signal via analog input of the CC-P ("WSFI"-line). In case the level is higher than 3,5V the input signal is a 16:9 source. If the level is lower than 2,4V the picture ratio is 4:3.

For generation of the appropriate DC-voltage on the Y/C-out rear the "WSRO"-line is controlled via pin 18 of [7408] by the CC-P (Pin 18 set to low means 4:3, pin 18 set to high determines 16:9).

The control of the switching voltage (Pin 8 of Scart 1) is done via 3-level-pin (nr.2) of the STV6618 [7408] and the transistors [7405], [7407] & [7409]. A "low" on pin 2 of [7408] causes around 11V on pin 8-Scart 1 (e.g. source with 4:3 picture-ratio active). Medium level (2,5V) on pin 2 of the STV6618 generates medium level (approx. 6V) on pin 8-Scart 1 (e.g. active source with 16:9) and a "high" on pin 2 of the STV6618 pushes pin 8-Scart 1 to "low" (e.g. inactive).

9.3.7 VPS/PDC- and Text-Dataslicer

For extraction of relevant information out of the video signal (time controlled recording, net-name-identification, time- & date- download) the STV5348 [7931] is used. Data transfer to/ from the CC is fully done via I²C-bus and the input signal for decoding is the same as the one being routed to the digital board for recording purposes ("A_YCVBS"-line).

9.3.8 **Analog Follow-Me**

This circuit compares the video signal from the internal frontend ("VFV") of the recorder with that one of the connected TV-set ("CVBS1"). The TV set delivers the signal via Scartcable. A comparator [7934] and several additional parts ([7932], [7933], ...) are used to compare the two video signals. In case of both input signals are equal the output-line of this circuit ("FOME") is set to low. Detection is made via an input port of the CC-P.

Analog board NAFTA- & APAC-Pal- version

9.4.1 Frontend NAFTA

[1701] demodulates the video signal from the antenna input. Tuner and IF-demodulator are in one unit. Also a modulator is included in that part. The audio- and video-signal to the modulator are the ones from the selected input or the playback path of the set ("AMCO"- and "D_CVBS"-line). The control of the tuner is fully done via I²C-bus by the CC-P. Via the "MSW"signal and [7701] the modulator is switched on and off. In opposite to this the antenna loop-through is opened or closed. In the APAC-Pal version POS [1700] is used with the difference that it demodulates only PAL- instead of NTSC-signals and has also no modulator. The "CSW_SSW" line switches the modulator between CH3 or CH4 in the NTSC-version. To achieve optimal tuning the "AFC"-signal is detected by the CC via an analog input; [3701], [3702] and [3703] are used for level adaptation (5V to 3V3). Pos [7700] is a driver for the video signal.

The sound demodulation is realized by the MSP34x5 [7600]. which is also fully controlled via I²C-bus by the CC-P (determination of bandwidth, amplitude, standard, ...). The audio signals are available at pin 30 and pin 31 of [7600] and fed as "AFER"- & "AFEL"-line to the audio-I/O for further processing. As this PCB is used for different regions (NAFTA and APAC) either MSP3425 or MSP3415 are assembled.

DVDR70 & DVDR75/0x1

Audio IO NAFTA / APAC Overview

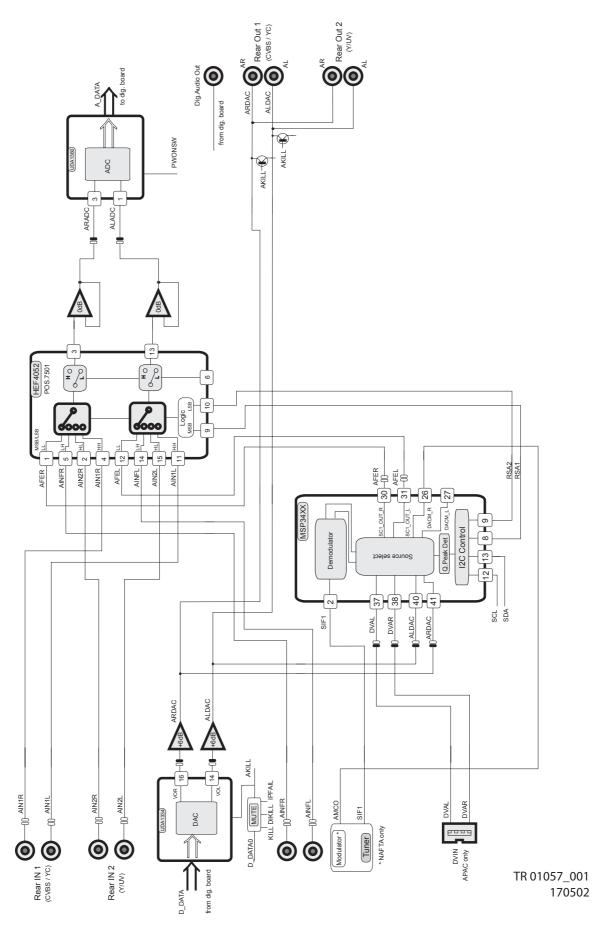

Figure 9-2

The sound processing is always done in stereo (that means separate left- and right-channel).

a) Record-Path:

The complete selection of the audio signal for recording is done by a HEF4052 [7501], which is a dual four-to-one multiplexer. The input lines for the selector [7501] are coming either from MSP [7600] ("AFEL"/"AFER") or cinch rear in 1 ("AIN1L"/"AIN1R") or cinch rear in 2 ("AIN2L"/"AIN2R") or the cinch in front ("AINFL"/AINFR"). The [7501] is controlled via "RSA1"-and "RSA2"-signals coming from the MSP [7600]. The MSP acts as a port expander of the CC-P. The Op-Amp on the output [7504] is necessary for performance reasons and acts also as a driver. The selected signals "ARADC" and "ALADC" are directly fed to the Audio-ADC.

As there can exist also a fifth input in case of DV-In is present the corresponding analog audio signals from the DVIO-board are firstly routed via extra cable and connector [1960] to the MSP, which acts as a preselector between audio from internal frontend or the DV-Input.

- b) Line-Out-Path: see chapter 9.4.3
- c) Digital Audio Output-Path without IOE-Print: Additionally to analog audio the set is also equipped with a digital output via cinch plug [1951]. The signal is generated on the dig. board and routed via audio interface cable and connector [1900] to the Ana-PCB. Here the "DAOUT"-line first passes a 6-fold inverter [7580] being used as a driver and for performance reasons (noise reduction, jitter, etc.). Afterwards a transformer [5580] is necessary to achieve the correct level and also to have a floating output with isolated ground before the signal is fed via [3580] to cinch plug [1951]. The capacitors [2580], [2582] and [2583] perform an AC-coupling between connector- and set-ground.
- d) Digital Audio Output-Path with IOE-Print: see chapter 9.3.4.f
- e) Digital Audio Input-Path with IOE-Print: see chapter 9.3.4.g

9.4.3 Audio ADC/DAC

The conversion of analog audio signals from the record-selector [7501] in the I/O ("ALADC"- & "ARADC") is done via UDA1361TS [7005]. This IC can process input signals up to 2Vrms by using an external resistor [3039], [3041] in series to the input pins. As the level from the DVIO-Board is only 1Vrms a 6dB step can be performed by setting pin 7 of [7005] to 3,3V via [7006] and "PWONSW"-line controlled by the CC-P to use the whole dynamic range of the ADC. All required clock signals are generated on the dig. board and only the audio data ("A_DAT"-line) are routed from Ana- to Dig.-PCB for further processing.

The transformation of dig. audio back to the analog domain is done by UDA1334BTS [7001]. All necessary clock signals are coming from the dig. board and dig. audio data ("D_DATA0"line) are converted into analog signals, which are available at pin 14 and pin 16 of [7001]. Afterwards an Op-Amp. [7002] (line driver & level adaptation) which also works as a low-pass-filter to increase signal performance (noise, distortions,...) is passed. Then both signals ("ALDAC" & "ARDAC") are directly routed to the rear cinch output. The DAC has also a mute possibility, which can be activated by setting pin 8 to 3,3V via [7003]. This mute is controlled either by the dig. board ("D_IKLL"-line) or the "IPFAIL"-signal from power-supply-unit. In addition to that the DAC [7001] and the cinch outputs can be killed (muted) in case of "digital silence" by the circuit around [7008], [7009] and [7010], when no audio data are available (e.g. "D_DATA0"-line zero).

The signals from the audio DAC part ("ARDAC"/"ALDAC") are directly routed to both cinch rear outputs, which are connected

in parallel. To avoid plops and any other audible noise on the output there is a mute-stage implemented [7509], [7511] for each channel. The activation is done via "AKILL"-line, which is a combination of the "KILL" from CC-P, "DAC_MUTE" from DAC-part and "IPFAIL" from the power-supply-unit. The circuit around [6430], [6431], [7430] and [7404] generates this signal.

Video-routing

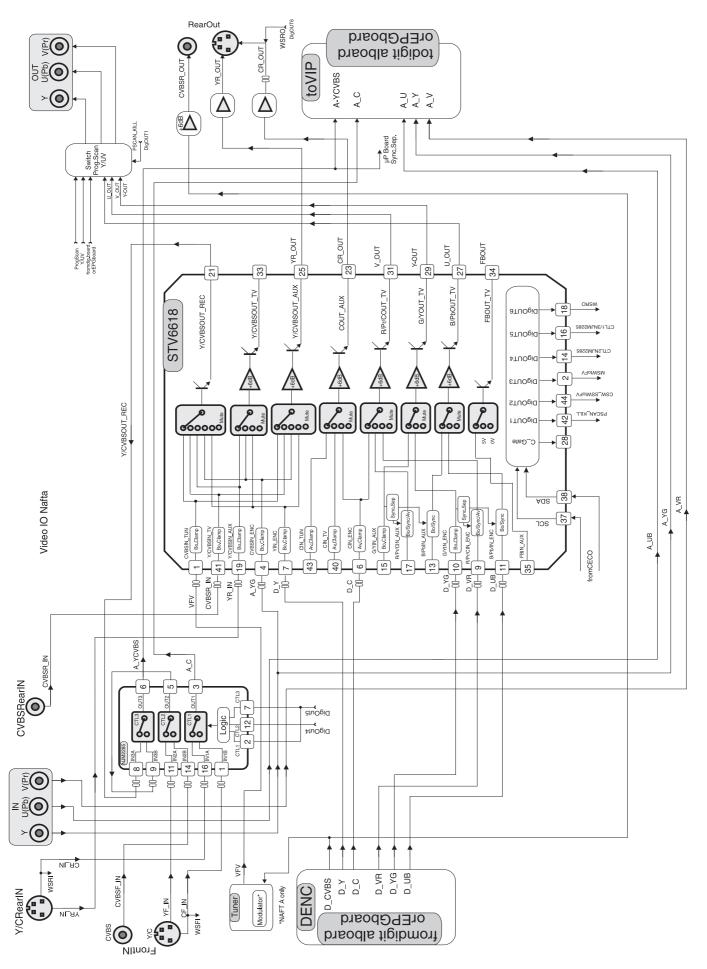

Figure 9-3

The Video-I/O-switching is basically realized by the matrix switch STV6618 [7408], which is controlled via I²C-bus by the CC. All used outputs excluding pin 21 (Y/CVBS-REC) have a 6dB-amplification and a 75 Ohms-driver-stage inside. This IC also includes several digital outputs, which are used for switching purposes on the analog board. The record selector inside the switch selects between the CVBS from frontend, the CVBS from Cinch-Rear or Y from the S-Video-input rear. Afterwards the signal passes another switch [7411] in which a selection between signals from the front or the preselected ones is done. The output signals of [7411] are fed as "A_YCVBS"- and "A_C"-line to the digital board for further processing.

To reduce the number of external presets there is only one station for CVBS or Y/C (front and rear). The set automatically detects between the two inputs depending on the presence of a video signal (sync separator-circuit on μP -sub-board) where Y/C has higher priority.

The Y/U/V-inputs are routed over the optional EPG board to the digital PCB. Only the Y-line has to be present additionally on pin 4 of [7408] for video recognition. Also all other video signal from the analog board are routed through the EPG board if present.

The signals "D_C" and "D_Y" are fed through [7408] (6dB amplification) and via [7406], [7409] used as driver to the S-Video output connector. The "D_CVBS" line is directly routed to the modulator and via the circuit around [7431] and [7432] amplified by 6dB before it is fed to the CVBS output plug. In case of EPG the signals from the digital board are routet through the EPG board where the selection between digital board video or EPG OSD is taken.

The Y/U/V signals from the digital board are also passing [7408] for 6dB amplification and driving purpose.

To achieve optimal picture quality the set is equipped with a simple progressive scan function based on a so-called line doubler. The complete generation of the signal is done on the digital board and via a separate cable and connector [1946] the corresponding Y/U/V lines are routed to the analog PCB. Also the YUVprogressive signals are switchable to EPG OSD on the EPG board if implemented. As there is only one Y/U/V output available a switching between interlaced and progressive output is necessary. While the transistors [7421], [7422], [7424], [7425], [7427] and [7428] are used as driver for Y/U/V progressive, [7423], [7426] and [7429] together with [7405] are necessary for killing these signals via pin 42 of [7408] in case the interlaced is selected ("PSCAN_KILL"-line set to low). If progressive output is active the pins 27, 29 and 31 of [7408] are set to high impedance and "PSCAN_KILL" is also high (e.g. 5V).

The detection of the picture ratio information on the Y/C inputs (rear or front) is done by measuring the DC-level on the Chroma signal via an analog input of the CC-P ("WSRI"- and "WSFI"-line). In case the level is higher than 3,5V the input signal is a 16:9 source, if the level is lower than 2,4V the picture ratio is 4:3.

For generation of the appropriate DC-voltage on the Y/C output the "WSRO"-line is controlled via pin18 of [7408] by the CC-P (Pin 18 set to low means 4:3, pin 18 set to high determines 16:9).

During Stand-By there is also no loop-through of any input to any output performed.

9.5 Digital Board

9.5.1 Record Mode

Video Part

Analog Video input signals CVBS, YC and UV(RGB for EURO and YUV for USA) are routed via the analog board to connector 1601 and sent to IC7500 SAA7118 (Video Input Processor). Digital video input signals (DV_IN_DATA(7:0)) are sent from the DIVIO board through the connector 1603 and further also to IC7500.

IC7500 (VIP) encodes the analog video to digital video and processes the digital video to a digital video stream (CCIR656 format). This output stream (VIP_YUV[7:0]) goes to IC7403 SAA6752H (EMPRESS) and to IC7100 Versatile Stream Manager. The latter uses the data for VBI (vertical blanking interval) extraction.

IC7403 (EMPRESS) encodes the digital video stream into a MPEG2 video stream that is fed to IC7100 (VSM).

Audio Part

I2S audio are sent from the analog board to IC7403 EMPRESS via connector 1602. The EMPRESS compresses I2S audio data into an AC3 audio stream which is fed to IC7100 (VSM).

Front-End I2S

IC7100 (VSM) interfaces directly to the different hardware modules such as Basic Engine, EMPRESS IC7403, MPEG decoder IC7200 (Sti5508) and buffers the data streams that are coming from or going to these hardware modules. In IC7100 (VSM), the video MPEG2 stream and the audio AC3 stream are multiplexed into a I2S packetized stream. The serial data are sent to the Basic Engine to be recorded.

Loop-Through

The multiplexed audio and video stream in the VSM is fed back via the parallel front-end interface to IC7200 (Sti5508). This IC decodes the MPEG stream into analog video and I2S audio. The video and audio signals are routed to the analog board via connectors 1601 and 1602. During recording, the recorded signal is present at the outputs of the analog board.

9.5.2 Playback Mode

During playback, the serial data from the Basic Engine is going directly to the Sti5505 via the serial front-end I2S interface. The Sti5508 is a MPEG & Audio/video decoder and has the following outputs:

- To the analog board:
 - analog video RGB, YC, CVBS
 - I2S audio (PCM format)
 - SPDIF audio (digital audio output)
- To the Progressive scan board:
 - digital video YC(7:0).

9.5.3 S2B Interface

The S2B interface between the VSM (IC7100) and the Servo processor MACE3 controls the Basic Engine during record and playback mode.

9.5.4 System Clock

System clocks(27MHz) of VSM, Sti5508, EMPRESS and Progressive Scan are generated by oscillator 7906

9.5.5 Audio Clock

During record mode, the audio clock ACC_ACLK_OSC is generated by IC7102 (PLL) because then, the audio clock must be sychronized with the incoming video (VIP_FID) from the VIP.

During playback mode, the audio clock ACC_ACLK_PLL is generated by the clock synthesizer IC7900 (MK2703S). Both ACC_ACLK_OSC(also goes to the EMPRESS as ACLK_EMP) and ACC_ACLK_PLL are fed to the VSM. This IC selects the appropriate clock to the STI5508. The EMPRESS IC derives from the incoming ACLK_EMP the I2S audio encoder clocks AE_BCLK and AE_WCLK which are sent to the VSM.

9.5.6 On/Off

The digital board is not powered in standby mode. Control signal ION, coming from the analog board, will enable the PSU and power the digital board.

DVDR70 & DVDR75/0x1

- ION = High: the digital board is in powered down standby mode
- ION = Low: the power supply to the digital board is enabled

9.5.7 Reset

Control signal IRESET_DIG, controlled by the microprocessor on the analog board is sent to the RESET LOGIC circuit.

- IRESET_DIG = Low in standby mode
- IRESET_DIG = High: the whole system is reset and the Digital board is waked up.

I2C Bus 9.5.8

Sti5508 is master of the I2C bus. The following IC's are controlled by the I2C bus:

- IC7201 NVRAM
- **IC7403 EMPRESS**
- IC7500 VIP
- IC7700 FLI2200 Video Deinterlacer Line Doubler
- IC7801 ADV7196 Video Denc

9.5.9 **EMI Bus**

The following IC's are connected to the External Memory Interface bus (EMI) which functions as system bus:

- IC7301 and 7302: Flash memories which contain the application and diagnostic software
- IC7100: VSM
- IC7200: MPEG AV Decoder

Block Diagram Digital Board

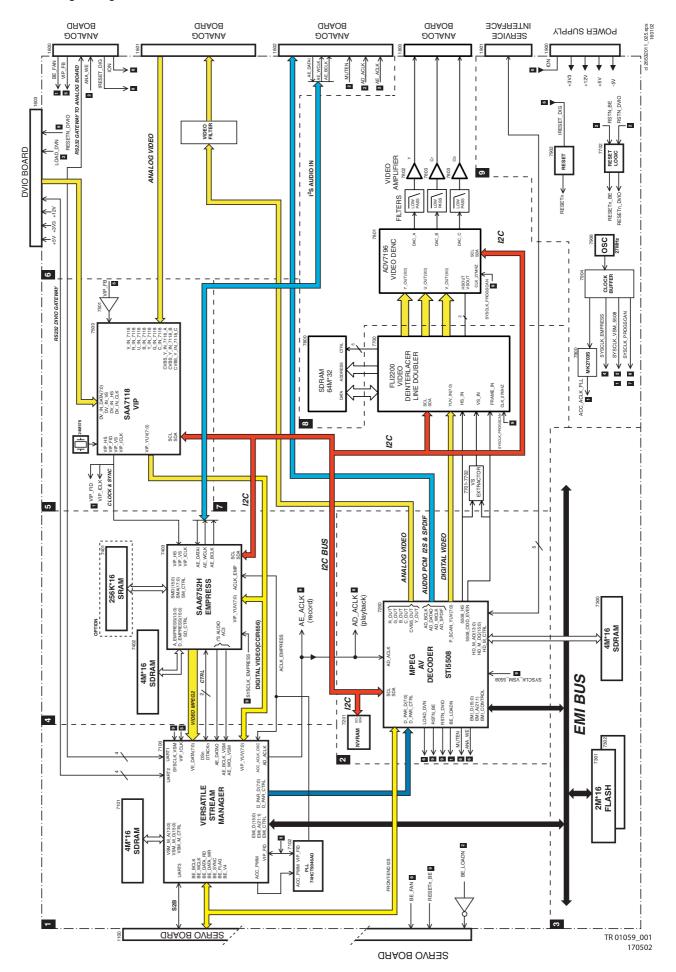

Figure 9-4

Description DIVIO Module

9.5.10 Progressive Scan

Description

The progressive scan part is integrated in the Digital Board and built around the SAGE Fli2200 de-interlacer / line doubler (7701). This I2C controlled de-interlacer uses a 64Mbit SDRAM (32bit x 2M) to perform high quality deinterlacing (meshing). The de-interlacer gets his digital YUV input data from the STi5508 (7200). The format of the digital YUV input to the SAGE is CCIR656 with separated Hsync, Vsync and odd/even signal running on 27Mhz.

DVDR70 & DVDR75/0x1

Because the STi5508 doesn't have a Vsync output the odd/ even output of this IC has to be translated to a Vsync signal. Some glue logic has been added to extract the vertical sync. The glue logic circuit consists of Flip-Flop IC 74HC74D (7701) and EXOR 74LVC86 (7702). The next diagram shows how the vertical sync is extracted.

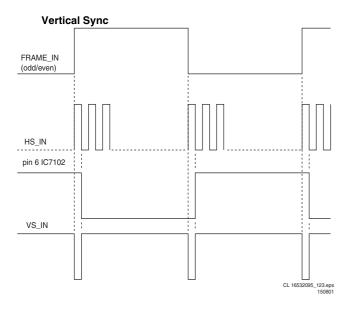

Figure 9-5

The output of the de-interlacer (4:4:4 progressive video) is fed to the Analog Devices ADV71967 MacroVision compliant DENC (7801).

The YUV current output of the DENC is fed via a low pass filter to the single supply output opamps AD8061/8062 (7802-7803). The analog video is fed via a 7 poled flex to the analog board where the YUV 2FH cinch connectors are located.

9.6 Divio 1.8 Board

9.6.1 Short Description of the Module:

The DVIO Module is a decoder for DV streams. Input is a stream from a DV-camcorder via IEEE1394. Outputs are CCIR656 Video and Analog audio (L+R). A serial control interface is present.

The following picture shows the location of the DVIO Module inside the DVDR set.

9.6.2 Block Diagram

Block Diagram DVIO1.8

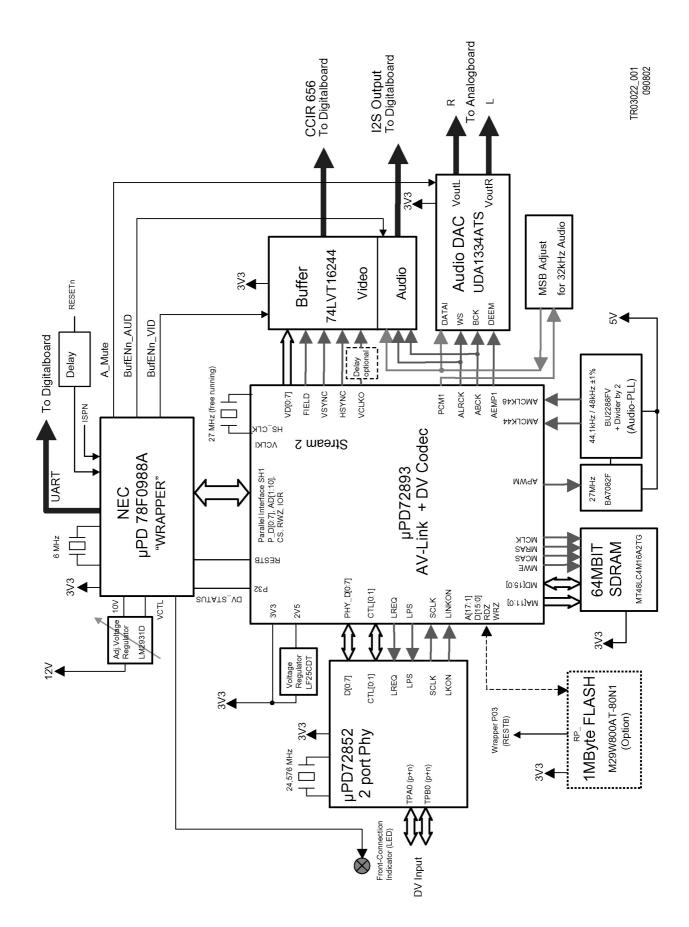

Figure 9-7

Functional Description

The DVIO module consists of the following blocks (see blockdiagram):

DVDR70 & DVDR75/0x1

- 1. IEEE1394 Interface
 - uPD72852 (7400) (Phy)
 - uPD72893 (7431) (Link part)
- 2. Micro-controller
 - uPD78F0988 (7802)
 - Voltage regulator LM2931 for generation of 10V programming voltage (7801)
- 3. Reset-circuitry
 - Power-on reset
 - Reset pulse-shortener
- 4. DV-Decoder
 - uPD72893 (7431) (Codec part)
 - 16MBit SDRAM (7430)
 - optional Flah-Memory M29W800AT for Firmware-Update of uPD72893 (7432)
- 5. Clocking & Audio PLL
 - Clock oscillator FXO-31FT (7601)
 - Audio-PLL: Voltage controlled oscillator BA7082F (7604), clock generator BU2288FV (7605), and clock divider 74LV74 (7606-A)
- 6. Audio Format adaption (MSB justified -> I2S), option
 - 74LV74 (7507-A, -B)
- 7. Audio & Video output
 - Audio DAC UDA1334ATS(7602)
 - Clock delay(7500)
 - Tristate buffer(7505)

IEEE1394 Interface

The 1394 interface consists of a uPD72852 physical layer and a uPD72893 link layer IC (uPD72893 integrated also DV-Decoder).

It has the following features:

- S400 operation (400 megabit per second)
- Two i.Link ports (4 pin), only one used
- AV link port

Micro-Controller

The uPD78F0988 processor has following extra features:

- 60 kilobyte of flash memory as program memory
- 2 kilobyte of internal data memory
- watchdog timer
- On board ISP(In-System-Programming) functionality

By use of In-System-Programming, it is possible to update the software of the DVIO board that is in the uPD78F0988. ISP can be made active by resetting the processor and keeping the ISPN pin low during reset. During ISP, the ISPN signal on the board has to be kept low. A programming voltage of 10V is activeted by the uPD78F0988 itself at the Vpp pin before programming procedure starts. When the ISP mode is active, the new program can be sent to the microprocessor through the serial port.

Reset-circuitry

The reset-circuitry consists of two parts.

First part (around transistor 7803) generates a reset pulse when the board is powered up.

Second part (around transistors 7804 & 7805) acts as a resetpulse shortener, i.e. a short reset pulse (4ms) is generated from the input signal RESETn which is much longer (usually 100ms). This is required to ensure correct operation of the Micro-controller after booting-up when RESETn is again deactivated

DV-Decoder

The uPD72893 decodes the stream into video data in 656 format and audio data in I2S format.

The microprocessor has the ability to read the status registers of the uPD72893. By reading these registers, extra data from

the DV stream, that is not decoded into audio or video, can be sent to the digital board using pin TXD of the serial interface. This data includes time stamp and some more.

Clocking and Audio PLL

The FXO-31FT generates the free-running 27MHz system clock. Video part of input DV-stream is in the uPD72893 adapted to the local 27MHz clock domain (skip, repeat frame). Because audio clock (11.2896Mz [fs=44.1kHz] or 12.288MHz [fs=32kHz, 48kHz]).

The uPD72893 integrates the phase comparator that drives the VCO BA7082F to a nominal frequency of 27MHz which in turn is converted by BU2288FV and 74LV74 to 11.2896MHz or 12.288Mhz, respectively.

The uPD72893 controls directly the frequency ratio of the BU2288FV.

Audio Format adaptation (MSB justified -> I2S), option

Due to a bug in 1st version of uPD72893 digital audio output is not correct in I2S mode when in 32kHz operation. As a workaround uPD72893 is generally configured in MSB justified mode and conversion to I2S mode is done externally via a 74LV74 device.

Can be disabled with later versions of uPD72893.

Audio & Video Output

The audio I2S data are sent to audio DAC UDA1334. Analog audio left and right signals are connected to the analog board. The tri-state buffer enables the digital video stream to the Video Input Processor on the digital board when the DV source is selected.

The clock delay synchronizes the AV clock with the AV data at the output.

9.7 **Digital Board Chrysalis 2.1**

9.7.1 Introduction

Block diagram 2nd generation DVD recorder

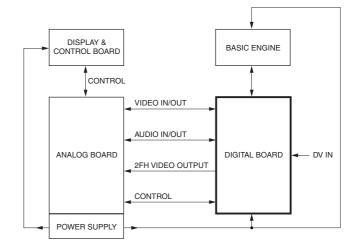

Figure 9-8

This 2nd generation Digital Board is based on the highly integrated 'Chrysalis' IC. Its predecessors, the 'Empire' and 'Empress' based boards, had two PWBs mounted on top of each other (due to separate DVIO board). For this new generation, all functionality is now available on one PWB in one BGA IC (Ball Grid Array) i.s.o. four VLSI ICs.

The board encodes and multiplexes analogue video and digital uncompressed audio (I2S) into an MPEG2 stream. This MPEG2 stream is formatted, to be recorded by the DVD+RW engine. In playback, the board will decode the MPEG2 stream into analogue and digital audio and into analogue video. In addition, a DV stream can be received via IEEE1394 (i-Link), and transformed to MPEG2 format.

There are versions foreseen, to generate a progressive scan analogue video output. In the standard Chrysalis board, the progressive video output is generated by the PNX7100. In the Chrysalis 'F' it is generated by the Faroudja FLi2301.

The Chrysalis Digital board is pin compatible with the Empress digital board in terms of A/V IO, BE interface, Power Supply, and Service interface. For functional enhancements, several connectors are added:IDE connector (HDD, AV3, PCMCIA, etc.).

9.7.2 Record Mode

Block diagram Chrysalis Digital Board

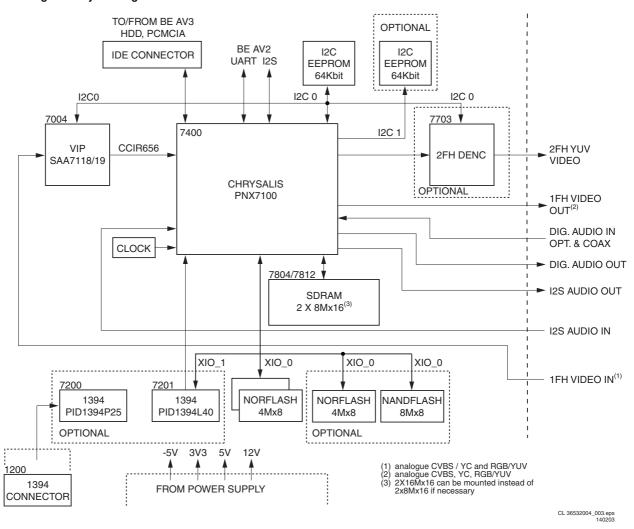

Figure 9-9

Video Part

The analogue video input signals CVBS, YC, and YUV/RGB (RGB for EURO and YUV for USA), are routed via the analogue board to connector 1904 and sent to IC7004 (SAA7118, Video Input Processor).

The digital video input signals are routed from the DV-In connector (item 1200) via ICs 7200 (1394 PHY) and 7201 (1394 LINK) to IC7400 (PNX7100, Chrysalis).

The multistandard Video Input Processor (VIP, IC7400) encodes the analogue video to digital video stream (CCIR656 format). It provides filtering of the analogue signals and separation of luminance and chrominance by a comb filter. The output stream, named ITU_IN(7:0), is then routed to the Chrysalis IC (PNX7100). This IC encodes and decodes the digital video stream into/from MPEG2 format.

Audio Part

I2S audio is sent from the analog board to the Chrysalis IC via connector 1900. The Chrysalis compresses the I2S audio data into an MPEG1-L2/AC3 audio stream.

Front-end I2S

IC7400 (Chrysalis) interfaces directly to the Basic Engine (BE) via connectors 1100 (clock and data) and 1105 (control). For future use (with AV3 BE module, HDD, or card reader) it also interfaces to an IDE bus via connector 1102.

It buffers the data streams that are coming from (or going to) these hardware modules.

In the Chrysalis, the video MPEG2 stream and the audio AC3 stream are multiplexed into an I2S stream. The serial data are sent to the Basic Engine for recording.

9.7.3 **Playback Mode**

During playback, the serial data from the Basic Engine is going directly to the PNX7100 via the serial front-end I2S interface. The PNX7100 is an MPEG CoDec and has the following outputs:

DVDR70 & DVDR75/0x1

- To the analogue board: analogue video RGB, YC, CVBS on connector 1904.
- I2S audio (PCM format) on connector 1900.
- SPDIF audio (digital audio output) on connector 1904.
- Progressive video on connector 1704.
- Communication gateway (RS232) on connector 1104.

Basic Engine Interfaces

AV2 Basic Engine (VAE8015 and VAE8020)

The UART interface (for the S2B commands) between the Chrysalis and the servo processor (MACE3 on the BE module), controls the AV2 Basic Engine during record and playback mode. For data transport, an I2S bus is used. For detailed information on the AV2 BE module, see Service Manual 3122 785 12470.

AV3 Basic Engine (VAE8030)

To be prepared for new developments, the Chrysalis Digital Board is equipped with two IDE busses (ATAPI). They can be used for connecting to the new generation Basic Engine (e.g. the AV3), a Hard Disc Drive (HDD), or a Smart Card Reader.

9.7.5 **Clock Distribution**

Clock distribution on Chrysalis board

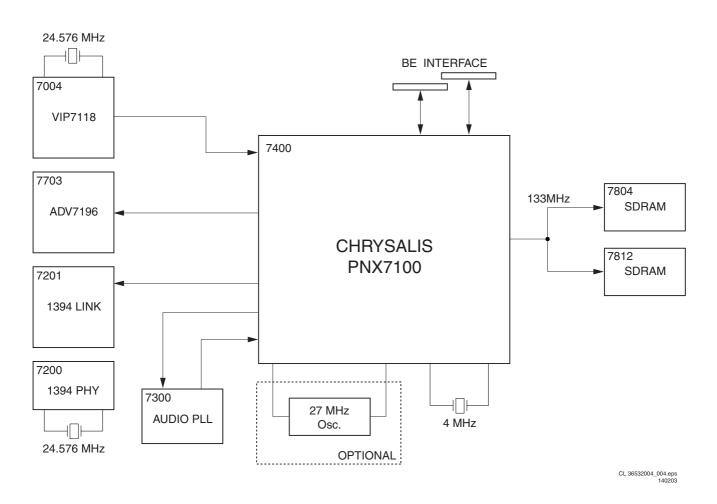

Figure 9-10

The PNX7100 has a complex clock system, which is needed to support the processes running at different frequencies such as video decoding, audio decoding or peripheral I/O devices etc. To ensure a synchronous initialisation of all the registers and state machines, all the PLLs are switched to their default frequency and the reset sequence is run at 4 MHz. Then when the booting control unit is correctly initialized and once it has captured all the booting parameters, it sets the PLLs to its functional frequency to allow the modules to run at their nominal frequencies. Thanks to a clock blocking mechanism, the frequency switching is glitch free.

System clocks:

- PNX7100 (IC7400, pins AF9 and AF10): 4 MHz provided by the xtal oscillator 7402.
- SAA7118 (IC7004, pins A3 and B4): 24.576 MHz provided by xtal 1001.
- ADV7196 (IC7703, pin 25): 27 MHz provided by PNX7100.
- SDRAM (IC7804 and 7808, pin 38): 133 MHz provided by the PNX7100.
- 1394-LINK (IC7201, pin 88): 49.152 MHz provided by 1394-PHY.
- 1394-PHY (IC7200, pins 59 and 60): 24.576 MHz provided by xtal 1201.

9.7.6 Power Supply

The Digital Board is not powered in standby mode. The control signal 'ION' (Inverse On), coming from the analogue board, will enable the PSU, and power the digital board.

- ION = High: the digital board is in powered down standby mode.
- ION = Low: the power supply to the digital board is enabled.

The 3V3, +5V, -5V, and +12V come from the PSU, while the 1V8 core voltage is generated on the board by a low voltage buck controller (item 7501). It provides the control for a DC-DC power solution producing an 1.8V output voltage over a wide current range. The NCP1570-based solution is powered from

12 V with the output derived from the 3V3 supply. It contains all required circuitry for a synchronous NFET (IC7500-1 and -2) buck regulator.

9.7.7 Memory

Several memories are used on the Chrysalis Digital Board:

- EEPROM IC7810: this memory contains all the necessary boot parameters of the board.
- EEPROM IC7809: this memory contains all the necessary parameters for the application.
- FLASH IC7807(05/11): this memory contains the application-, diagnosis-, and service software.

9.7.8 Reset

Reset concept Chrysalis board

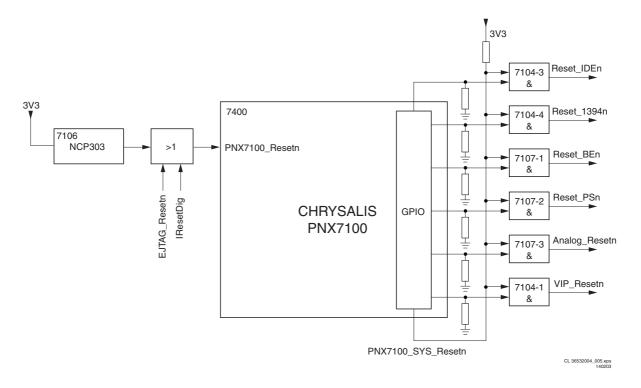

Figure 9-11

The voltage detector NCP303LSN29 (IC7600) provides the reset signal PNX7100_RESETn (active 'low') with the correct timing behavior. This circuitry functions as a Power-On Reset (POR) module, which detects the minimum functional voltage that is needed by the device. It also detects any voltage drop. When the power voltage is outside the nominal range, a reset signal is generated by the POR module and fed to the reset module which controls the individual reset of the different peripherals and processing units.

There are two control lines which can overrule this reset signal:

- IRESET_DIG (controlled by the microprocessor on the Analogue Board).
- EJTAG_RESETn (only for production).

They can pull the output of the NCP303LSN29 (item 7106) down via a shottky diode.

So when the output signal PNX7100_RESETn is 'low', the board will reset. When this signal is 'high', the board is up and running.

The PNX7100_SYS_RESETn is a general enabling signal for the different reset lines. All other reset lines are directly driven from Chrysalis port pins (e.g. MPIO13_IDE1_RESETn). All

reset lines are logically connected via 74LVC08D (item 7104) and (item 7107) AND-gates. If both reset signals are low, all other external devices are initialised.

9.7.9 I2C Bus

The PNX7100 is the master of the I2C bus (during reset, external I2C masters are allowed). The following ICs are controlled by the I2C bus:

- IC7809.
- IC7810 NVRAMs.
- IC7004 VIP.
- IC7700 FLI2301 Video De-interlacer Line Doubler (for Chrysalis-F boards).
- IC7703 ADV7196 Video Enc (for progressive scan done by Chrysalis).

9.7.10 I/O Connectors

AIO Connector (item 1900)

The Audio In/Out (AIO) connector is used to interchange digital audio signals between Analog- and Digital Board.

DAIO Connector (item 1901)

The Digital Audio In/Out (DAIO) connector is used to interchange digital audio (SPDIF) signals between the IOE-Board and the Digital Board.

DVDR70 & DVDR75/0x1

VIO Connector (item 1904)

The Video In/Out (VIO) connector is used to interchange analogue video signals between Analog- and Digital-Board.

9.7.11 Progressive Scan

Introduction

There are two versions foreseen, to generate a progressive scan analogue video output:

- In the standard Chrysalis board, the 'low end' progressive video output is generated by the PNX7100.
- In the Chrysalis 'F', the 'high end' progressive output is generated by the Faroudja FLI2301. This IC offers additionaly DCDi, upscaling to HDTV, and picture enhancement.

Description

The progressive scan part is integrated in the Digital Board and built around the FLI2301 de-interlace/line doubler (7701). This I2C controlled de-interlace uses a 64Mbit SDRAM (32bit x 2M) to perform high quality de-interlacing (meshing). The deinterlace gets its digital YUV input data from the PNX7100 (7400). The format of the digital YUV input to the Fli2301 is CCIR656 with separated Hsync, Vsync, and odd/even signal running on 27MHz.

9.8 **Service UART Interface**

Logic IC 74HCT14D (item 7111) is used to make a level conversion from microprocessor (LVTTL) to +/-5V (compatible with most RS232 interfaces) and vice versa. The control line MPIO19_CTL_SERVICE is used to activate service and diagnostic SW at start up procedure. The connectivity is provided via an external service tool.

9.9 **EPG Nafta Board**

9.9.1 General

Two ASICs from Gemstar, GS501 (item 7100) and GS502 (item 7201), generate the EPG OSD. The host P controls both ICs via the I2C bus (pins 45 and 48). A RAM memory (item 7102) and a Flash memory with the firmware (item 7101) belong also to the periphery of these ASICs. A PIC processor (item 7303) generates the POR_N reset for this system. The POR_DC reset comes from the set, and is active after AC power 'on'. A port expander from the host, controls the EXT_RESET signal. This port expander (item 7200) is also used for switching the video paths on the EPG

Either the board works in 'Loop Trough' mode, or (for EPG) the output path is switched to the 'EPG RGB' video.

Blockdiagramm EPG-Modul Nafta

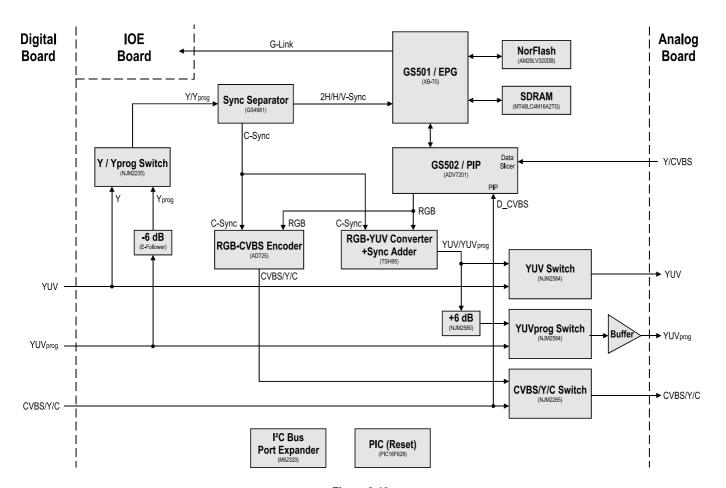

Figure 9-12

9.9.2 Loop trough

For 'Loop Trough' the input video signals (CVBS, YC, YUV, and YUV-progressive) from the Digital board are passing three video switches before going to the Analog board.

- Item 7503 for CVBS and Y/C.
- Item 7502 for YUV-interlaced.
- Item 7501 for YUV-progressive.

9.9.3 EPG RGB Video

A V-sync and H-sync (for progressive = 2H-sync) are necessary for outputting an RGB video. A sync separator (item 7703) generates these syncs. Input for the sync separator is either the 1fh or the 2fh luminance signal from the Digital board. A video switch (item 7700) makes the selection. For progressive video, the signal must be attenuated (item 7701).

The RGB signal goes via emitter followers (items 7202, 7203, and 7204) to an RGB-to-YUV converter and to an RGB-to-CVBS, Y/C converter.

The RGB-to-YUV converter consists of four OpAmp's, which are necessary for RGB/YUV conversion (item 7600-B, -C, and -D) and for adding the C-sync to the Y signal (item 7600-A). The RGB-to-CVBS, Y/C conversion is realized by IC7602. The oscillator (item 7601) is necessary for generating the chroma carrier

With transistor 7603 the conversion stages can be switched 'off' for power saving.

For the PIP (Picture in Picture) feature, the D_CVBS video signal from the Digital board is used. This signal is fed to Pin 10 of IC7201. For scanning the EPG data, the A_YCVBS signal from the Analogue board is fed to pin 8 of IC7201.

9.9.4 Power supply

The supply for the video stages and the EPG digital part, are generated via DC-DC converters (items 7400, 7401, and 7403) out of the 12STBY.

9.10 EPG Europe Board

9.10.1 General

The ARM7 based microprocessor (item U1) and an ASIC (Gemstar GSA03, item U2) generates the EPG OSD data (RGB or YUV-interl./progr.). The host P on the Digital board, controls both ICs via the I2C bus. A RAM memory (item U7)

and two Flash memories (items U8 and U9) with the firmware and EPG data, belong also to the periphery of the ASIC. A resistor and capacitor (items R1 and C6) generate the reset for this system. The IPOR reset comes from the set and is active after main power 'on'. A port expander from the host, controls the nGCLR reset signal. This port expander (item U31) is also used for switching the video paths on the EPG board.

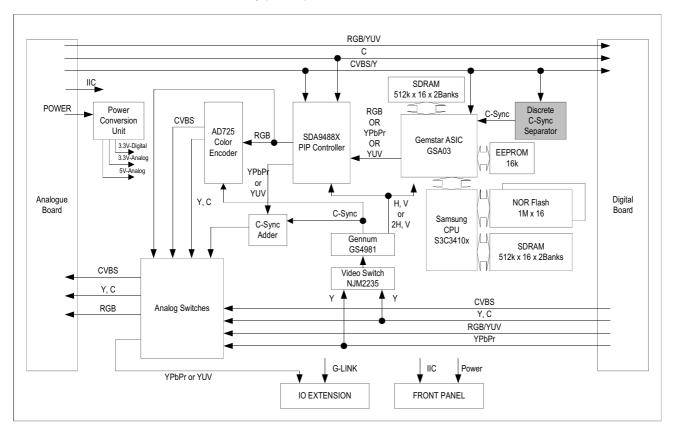

Figure 9-13

Either the board works in 'Loop Trough' mode, or (for EPG) the output path is switched to the 'EPG RGB' video.

9.10.2 Loop Trough

For 'Loop Trough', the input video signals (CVBS, YC, RGB, YUV-interlaced, and YUV-progressive) from the digital board are passing three video switches before going to the Analogue board.

- Item U15 for CVBS and Y/C selection between EPG and Loop trough.
- Items U16, U18, and U19 (and periphery) for RGB selection between EPG and Loop trough.
- Items U42 and U17 for YUV-interlaced and YUVprogressive selection between EPG and Loop trough.
 These signals are amplified (items U13B, C, and D) for driving a 75-Ohm output.

Note: RGB and YUV-interlaced (VR_DVD, UB_DVD, YG_DVD) are the same signals. It depends on the software, which signal is chosen.

9.10.3 EPG RGB

A V-sync and H-sync (for progressive = 2H-sync) are necessary for outputting an EPG video. A sync separator (item U10) generates these syncs. Input for the sync separator is either the 1fh or the 2fh luminance signal from the Digital board. A video switch (item U50) makes the selection.

The EPG signal goes via a PIP-inserter IC (item U11 and pheripherals) that inserts a PIP (Picture In Picture) into the EPG OSD. Source for this PIP is the CVBS signal from the digital board.

When the PIP output is a YUV signal, the Y signal is without a sync. Therefore, this sync must is added with item U13A.

For RGB-to-CVBS, Y/C conversion is realized by a PAL conversion IC (item U14). The oscillator (item Y5) is necessary for generating the chroma carrier.

For scanning EPG data, the A_YCVBS signal from the Analog board is used. This signal is fed to pin 189 of item U2. There is also a sync from the Analog board necessary. A discrete circuit (items Q18-Q23 and periphery) generates it.

9.10.4 Power supply

The supply for the video stages and the EPG digital part are generated via DC-DC converters and linear regulators (items U28, U40, and U41) out of the 12VSTBY.

9.11 I/O Extension Board

This board feeds the internal S/PDIF signal from the Digital board to an optical and/or digital out connector. For European players, also an YUV output is present on this board.

PIN FUNCTION DESCRIPTIONS

Pin	Input/Output	Pin Name	Description
1	I	DGND	Digital Ground.
2	I	MCLK	Master Clock Input. Connect to an external clock source at either 256 F_S , 384 F_S , 512 F_S , 768 F_S , or 1024 F_S .
3	I	CLATCH	Latch Input for Control Data. This input is rising-edge sensitive.
4	I	CCLK	Control Clock Input for Control Data. Control input data must be valid on the rising edge of CCLK. CCLK may be continuous or gated.
5	I	CDATA	Serial Control Input, MSB first, containing 16 bits of unsigned data per channel. Used for specifying channel-specific attenuation and mute.
6		NC	No Connect.
7	I	$192/\overline{48}$	Selects 48 kHz (LO) or 192 kHz Sample Frequency.
8	О	ZEROR	Right Channel Zero Flag Output. This pin goes HI when Right Channel has no signal input for more than 1024 LR Clock Cycles.
9	I	DEEMP	De-Emphasis. Digital de-emphasis is enabled when this input signal is HI. This is used to impose a 50 μ s/15 μ s response characteristic on the output audio spectrum at an assumed 44.1 kHz sample rate. Curves for 32 kHz and 48 kHz sample rates may be selected via SPI control register.
10	I	$96/\overline{48}$	Selects 48 kHz (LO) or 96 kHz Sample Frequency.
11, 15	I	AGND	Analog Ground.
12	О	OUTR+	Right Channel Positive Line Level Analog Output.
13	O	OUTR-	Right Channel Negative Line Level Analog Output.
14	О	FILTR	Voltage Reference Filter Capacitor Connection. Bypass and decouple the voltage reference with parallel 10 μF and 0.1 μF capacitors to the AGND.
16	О	OUTL-	Left Channel Negative Line Level Analog Output.
17	О	OUTL+	Left Channel Positive Line Level Analog Output.
18	I	AVDD	Analog Power Supply. Connect to Analog 5 V Supply.
19		FILTB	Filter Capacitor Connection. Connect 10 µF capacitor to AGND (Pin 15).
20	I	IDPM1	Input Serial Data Port Mode Control One. With IDPM0, defines 1 of 4 serial modes.
21	I	IDPM0	Input Serial Data Port Mode Control Zero. With IDPM1, defines 1 of 4 serial modes.
22	0	ZEROL	Left Channel Zero Flag Output. This pin goes HI when Left Channel has no signal input for more than 1024 LR Clock Cycles.
23	I	MUTE	Mute. Assert HI to mute both stereo analog outputs. Deassert LO for normal operation.
24	I	RESET	Reset. The AD1852 is reset on the rising edge of this signal. The serial control port registers are reset to the default values. Connect HI for normal operation.
25	I	L/RCLK	Left/Right Clock Input for Input Data. Must run continuously.
26	I	BCLK	Bit Clock Input for Input Data. Need not run continuously; may be gated or used in a burst fashion.
27	I	SDATA	Serial Input, MSB first, containing two channels of 16, 18, 20, and 24 bits of twos complement data per channel.
28	I	DVDD	Digital Power Supply Connect to digital 5 V supply.

SM_D9	177	input/output	4	reserved (do not connect), static memory data input/output bit 9 with internal pull-down resistor
SM_D5	178	input/output	4	reserved (do not connect), static memory data input/output bit 5 with internal pull-down resistor
SM_D10	179	input/output	4	reserved (do not connect), static memory data input/output bit 10 with internal pull-down resistor

IC7700: FLI2200, Digital Board 1.5, Deinterlacer

Simplified Block Diagram

Pin description

Pin #	Name	Description
		•
52	NOMEM	No Memory Mode control input. This pin controls the operation of the FLI2200 as follows: When this pin is set low the device is used with external field memories and operates in the full set of deinterlacing modes, i.e., motion adaptive video deinterlacing and full frame film source deinterlacing using 3:2 pulldown detection (2:2 pulldown for 625/50 sources). When this pin is set high the FLI2200 is forced into the intra-field only deinterlacing mode, which requires no external memories, allowing the FLI2200 to be used in low-cost applications where the ultimate video quality is not a requirement. <i>To ensure proper startup of the SDRAMs this pin should be set high during the power-up sequence</i> . This can be overridden by the NMOvr bit, bit 1 in register $05_{\rm H}$, allowing this function to be set or changed via the I ² C bus. Please refer to the description of register $05_{\rm H}$ for details.
27-18	CAVIN	10 hit among an hyminones signal input has. The mode is get by the IEODMAT mine. This con-
2/-18	G/YIN ₉₋₀	10-bit green or luminance signal input bus. The mode is set by the IFORMAT $_{2-0}$ pins. This can be overridden by the IFmtOvr bit, bit 3 in register 00_H , allowing this function to be set or changed via the I ² C bus. Please refer to the description of register 00_H for details. This signal is sampled on the rising edge of PIXCLK.
15-6	B/CbIN ₉₋₀	10-bit blue or Cb chroma signal input bus. The mode is set by the IFORMAT ₂₋₀ pins. This can be overridden by the IFmtOvr bit, bit 3 in register 00 _H , allowing this function to be set or changed via the I ² C bus. Please refer to the description of register 00 _H for details. Bits 6, 4 and 3 in register 08 _H specify the busses used in the multiplexed modes. In all cases the signals are sampled on the rising edges of PIXCLK. In the Y Cb Cr and Y Pb Pr modes the Cb or Pb signal is sampled on alternate rising edges of PIXCLK in 4:2:2 mode. The frequency of PIXCLK will be 27 MHz in the multiplexed Y/Cb/Cr mode and 13.5 MHz in all other modes. These pins should be tied low when not used.
39-35 32-28	R/CrIN ₉₋₀	10-bit red or Cr chroma signal input bus. The mode is set by the IFORMAT ₂₋₀ pins. This can be overridden by the IFmtOvr bit, bit 3 in register 00 _H , allowing this function to be set or changed via the I ² C bus. Please refer to the description of register 00 _H for details. Bits 6, 4 and 3 in register 08 _H specify the busses used in the multiplexed modes. In all cases the signals are sampled on the rising edges of PIXCLK. In the Y Cb Cr mode the Cr signal is sampled on alternate rising edges of PIXCLK in 4:2:2 mode. The frequency of PIXCLK will be 27 MHz in the multiplexed Y/Cb/Cr mode and 13.5 MHz in all other modes. These pins should be tied low when not used.
3	HSYNCREFI	Horizontal sync or reference. The horizontal sync or reference of the input signal should be connected to this pin. The function is programmed with bit 4 in register $00_{\rm H}$. The polarity and position of the sync or reference pulse relative to the start of active video are both programmable within a small range. When the FLI2200 is used in the ITU-R BT 601/D1 input mode with embedded syncs (IFormat = 110) this input is not used and should be tied low; in this case all sync information will be derived from the signal.
4	VSYNCREFI	Vertical sync or reference. The vertical sync or reference of the input signal should be connected to this pin. The function is programmed with bit 4 in register $00_{\rm H}$. The polarity and position of the sync or reference pulse relative to the start of active video are both programmable within a small range. When the FLI2200 is used in the ITU-R BT 601/D1 input mode with embedded syncs (IFormat = 110) this input is not used and should be tied low; in this case all sync information will be derived from the signal.
5	FLDIN	Field identifier input. The field identifier output of the source signal should be connected to this pin. A low setting signifies an even field and a high level signifies an odd field. When bit 4 in register 00_H is set low, the input timing is based on HREF and VREF and this signal is required. When this bit is set high the input timing is based on HSYNC and VSYNC and this signal is generated internally and is not required. When bit 5 in register 06 is set high this signal is also used as the frame boundary identifier for 30 Hz film sources.

Pin Connections and Functions

		and Functions
Pin#	Name	Description
See list	V _{SS}	Ground connections. Connect to the digital ground plane. Pins: 2, 17, 34, 55, 64, 74, 85, 96, 106, 115, 124, 132, 138, 145, 152, 159, 168
See list	V_{DD33}	Pad Ring digital power connections. Connect to the digital 3.3 volt power supply and decouple to the digital ground plane. Pins: 1, 33, 63, 73, 84, 95, 105, 114, 123, 137, 144, 151, 167
See list	V_{DD25}	Core Logic digital power connections. Connect to the digital 2.5 volt power supply and decouple to the digital ground plane. Pins: 16, 54, 107, 158
43	AV_{SS}	Ground connection for the clock PLL circuits. Connect to the digital ground plane
42	AV_{DD}	Analog power connections for the clock PLL circuit. Connect to a separately decoupled 2.5 volt power supply and decouple directly to the ${\rm AV}_{\rm SS}$ pin
49	RESETB	Reset. When this input is set low it will reset all the internal registers to the default states. Refer to the section on the control registers for details of these states. The device must be reset after it is powered-up.
53	OE	When this pin is set high the outputs of the FLI2200 will be enabled; when it is set low the outputs will be set into a high-impedance state.
56-58	IFORMAT ₂₋₀	Input signal format control. The settings of these pins set the format of the input signal. This can be overridden by the IFmtOvr bit, bit 3 in register 00_H , allowing this function to be set or changed via the I^2C bus. Please refer to the description of register 00_H for details.
59-61	OFORMAT ₂₋₀	Output signal format control. The settings of these pins set the format of the output signal. This can be overridden by the OFmtOvr bit, bit 3 in register 07_H , allowing this function to be set or changed via the I ² C bus. Please refer to the description of register 07_H for details.
44-45	DADDR ₁₋₀	The settings of DADDR ₁₋₀ allow the device address of the control bus to be programmed to prevent conflict with the other devices connected to the bus. DADDR ₁₋₀ allow the device address to be set to any of the following values: C0/C1 _H , C2/C3 _H , E0/E1 _H , E2/E3 _H . Please refer to the section "Control Bus Operation and Protocol" for further information.
46	MODE	When this pin is set low the control bus will operate in the slave mode; allowing the device to programmed from an external controller. When it is set high the FLI2200 will self-program from an external I ² C memory connected to the bus. Please refer to the "Control Bus Operation and Control Protocol" section for more details.
47	SDA	2-wire serial control bus data. Data can be written to the control registers via this pin when it is in the input mode and data can be read from the status registers when it is in the output mode. Refer to the section on the serial port for timing and format details and to the section on the registers for programming information.
48	SCL	2-wire serial control bus clock. When the control port operates in slave mode this pin will be an input and when it operates in the self programming mode it will be an output.
40	PIXCLK	Pixel clock input. This clock is used to drive all the circuits in the FLI2200. An internal PLL is used to upconvert this clock to provide the master clock signal and other clocks used internally. Note that when the FLI2200 is used in the D1 input mode the PIXCLK input should run at the rate of two cycles per pixel (one for luma and one for chroma).
62	N/P/IN/OUT	NTSC/PAL input or output. The default function of this pin is NTSC/PAL signal indicator output. When the input video signal is a 525 line signal this pin will be set high and when it is a 625 line signal the pin is set low. This function of this pin can be programmed to be an input according to the setting of this pin if the NPOp ₁₋₀ bits, bits 5-4 in register $03_{\rm H}$, are set to $00_{\rm H}$, overriding the internal line counter. i.e., it will treat the signal as a 525 line signal when it is set high and a 625 line signal when it is set low.

Pin#	Name	Description
125-131 133-136	ADDR ₁₀₋₀	SDRAM Address bus. This signal bus is used to address the external SDRAM(s) used for field memories. It should be connected to the A_{10-0} bus of the memory chip(s). Please refer to the Applications section of this data sheet for further details.
176-169 166-160 157-153 150-146 143-139	DATA ₂₉₋₀	SDRAM Data bus. This signal bus is used to transfer the data to and from the external SDRAM(s) used for field memories. It should be connected to the DQ_{29-0} bus of the memory chip when using a 64 Mbit SDRAM. When using two 16 Mbit SDRAMs this 30-bit bus may be connected to the two 16-bit data busses of the memories in two ways: either connect 16 lines to one chip and 14 to the other, or connect 15 to both. In all cases the two unused data lines on the memory chip(s) should be connected to ground via 22 k? resistors. Please refer to the Applications section of this data sheet for further details.
118	MEMCLKO	SDRAM clock and 2x output sampling clock. This clock is derived from PIXCLK and will be at double the frequency of YCLKO. This active signal should be connected to the CLK pin(s) on the SDRAM(s). When the 10-bit output mode selected the output signals will also change at this clock rate and this should then be used as the output clock
119	WEN	SDRAM Write Enable. This active low signal should be connected to the WE pin(s) on the SDRAM(s).
120	RASN	SDRAM Row Address Select. This active low signal should be connected to the RAS pin(s) on the SDRAM(s).
121	CASN	SDRAM Column Address Select. This active low signal should be connected to the CAS pin(s) on the SDRAM(s).
122	BSEL	SDRAM Bank Select. When using two 16 Mbit SDRAMs this signal should be connected to the BA (also called BS or A ₁₁) pin on both SDRAMs. When using a 64 Mbit SDRAM this signal should be connected to the BA0 (also called BS0 or A ₁₁) pin on the SDRAM and BA1/BS1 (also called BA when BA0 is referred to as A ₁₁) should be tied low.
41, 50, 51, 109, 111	TEST ₄₋₀	These pins are used for test purposes only and should always be tied low for normal operation.
112, 113	TESTO ₁₋₀	These pins are test outputs and should be left unconnected in normal operation.

IC7400: uPD72852, DVIO Board, IEEE1394 Physical Layer Chip

BLOCK DIAGRAM

1.1 Cable Interface Pins

Name	Pin No.	1/0	Function			
ТрА0р	39	1/0	Port 0 twisted pair cable A positive phase I/O			
TpA0n	38	I/O	Port 0 twisted pair cable A negative phase I/O			
ТрВ0р	37	1/0	Port 0 twisted pair cable B positive phase I/O			
TpB0n	36	1/0	Port 0 twisted pair cable B negative phase I/O			
TpA1p	46	1/0	Port 1 twisted pair cable A positive phase I/O			
TpA1n	45	1/0	Port 1 twisted pair cable A negative phase I/O			
ТрВ1р	44	I/O	Port 1 twisted pair cable B positive phase I/O			
TpB1n	43	1/0	Port 1 twisted pair cable B negative phase I/O			
SUS/RES	19	1	Suspend/Resume function select 1: Suspend/Resume on (IEEE1394a-2000 compliant) 0: Suspend/Resume off (P1394a draft 1.3 compliant)			
CPS	32	Î	Cable power status Connect to the cable through a 390 k Ω resistor and to GND through a 100 k Ω resistor. 0: Cable power fail 1: Cable power on			

1.2 Link Interface Pins

Name	Pin No.	I/O	Function
D0	8	1/0	Data input/output (bit 0)
D1	9	1/0	Data input/output (bit 1)
D2	11	1/0	Data input/output (bit 2)
D3	12	1/0	Data input/output (bit 3)
D4	14	1/0	Data input/output (bit 4)
D5	15	1/0	Data input/output (bit 5)
D6	17	I/O	Data input/output (bit 6)
D7	18	1/0	Data input/output (bit 7)
CTL0	5	1/0	Link interface control (bit 0)
CTL1	6	1/0	Link interface control (bit 1)
LREQ	63		Link request input
SCLK	2	0	Link control output clock
			LPS 1: 49.152 MHz output
			LPS 0: Clamp to 0 (The clock signal will be output within 25 μ sec after change to "0")
LPS	59	1	Link power status input
			0: Link power off
			1: Link power on (PHY/Link direct connection)
LKON	58	0	Link-on signal output
			Link-on signal is 6.144 MHz clock output.
			Please refer to 4.2 Link-on Indication.
DIRECT	50	1	PHY/Link isolation barrier control input
			0: Isolation barrier
			1: PHY/Link direct connection

1.3 Control Pins

Name	Pin No.	I/O	Function
PC0	26	1	Power class set input
PC1	27	1	This pin status will be loaded to Pwr_class bit which allocated to PHY register 4H.
PC2	28	- î	IEEE1394a-2000 chapter [4.3.4.1]
СМС	30	1	Configuration manager capable setting
			This pin status will be loaded to Contender bit which allocated to PHY register 4H.
			0: Non contender
			1: Contender
RESETB	55	1	Power-on reset input
			Connect to GND through a 0.1 μ F capacitor.
			0: Reset
			1: Normal
SPD	61	1	Speed select
			0: MAX. S200
			1: MAX. S400

1.4 IC

Name	Pin No.	I/O	Function
IC(AL)	29, 51		Internally Connected (Low Clamped) Connect to GND.
IC(DL)	3	•	Internally Connected (Low Clamped) Connect to GND.

1.5 Power Supply Pins

Name	Pin No.	I/O	Function
AVoo	25, 31, 40, 47, 54	-	Analog power
AGND	24, 33, 35, 42, 49, 52, 53	-	Analog GND
DV _{DD}	4, 10, 20, 56, 60	-	Digital VDD
DGND	1, 7, 13, 16, 21, 57, 64	14	Digital GND

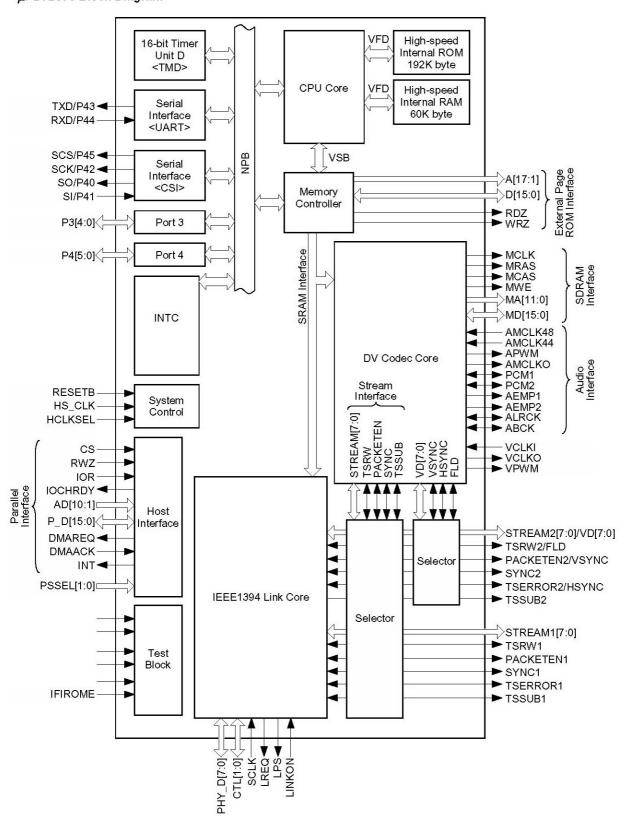

1.6 Other Pins

Name	Pin No.	1/0	Function
TpBias0	41	0	Port 0 twisted pair output
TpBias1	48	0	Port 1 twisted pair output
RI1	34	-	Resistor connection pin1 for reference current generator Connect to GND through a 9.1 k Ω resistor.
ΧI	23	-	Crystal oscillator connection XI
хо	22	8	Crystal oscillator connection XO
TEST	62	-	Test pin Internally connected (Low clamped). Connect to GND.

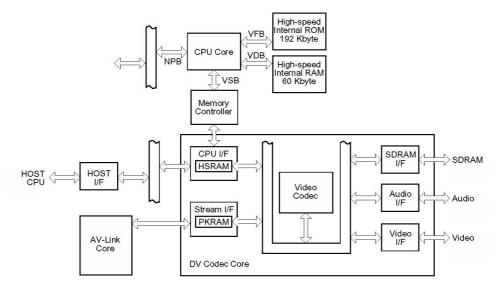

IC7431: uPD72893, DVIO Board, IEEE1394 Link Layer Chip and DV Decoder

1. PIN FUNCTIONS

(1) Link-related pins

Pin Name	Pin No.	1/0	Function	Active	After	Alternate
					Reset	Function
LINKON	18	Ĩ	Link-on signal input.	-	Ĭ	_
			Clock input.			
			Inputs 0 if LPS is active.			
LPS	17	0	Link power status output	-	0	
			Link power OFF : 0			
			Link power ON : 2.7 MHz pulse output (54 MHz host			
			clock divided by 20)			
LREQ	16	0	Link request output	-	0	-
SCLK	15	Ĩ	Clock input for Link control	_	Ī	_
			When LPS is active : 49.152 MHz input			
			LPS = 0 : Fixed to 0			
CTL[1:0]	12, 13	1/0	PHY/Link control signal I/O	-	I	-
PHY_D[7:0]	2 to 4,	1/0	Data I/O between PHY and Link	_	I	=
	6 to 8,					
	10, 11					
STREAM1[7:0]	26 to 19	1/0	ISO data bus of stream interface 1 Note	-	I	-
PACKETEN1	27	1/0	Packet enable signal I/O to/from stream interface 1 Note	H/L	Ĺ	<u>=</u>
TSERROR1	28	1/0	Packet error signal I/O to/from stream interface 1 Note	H/L	I	=
TSRW1	29	1/0	Data read/write enable signal I/O to/from stream interface 1 Note	-	Ĭ	=
SYNC1	30	1/0	Frame sync signal I/O to/from stream interface 1 Note	H/L	Î	-
TSSUB1	32	1/0	I :Inputs the packet gap signal when the stream is input	H/L	ı	-
			through the stream interface			
			O :Not used. Connect this pin to VDD or GND via a resistor.			
STREAM2[7:0]	47 to 40	1/0	ISO data bus of stream interface 2 Note	1 	Ĭ	VD[7:0]
PACKETEN2	33	1/0	Packet enable signal I/O to/from stream interface 2 Note	H/L	_	VSYNC
TSERROR2	34	I/O	Packet error signal I/O to/from stream interface 2 Note	H/L	I	HSYNC
TSRW2	36	1/0	Data read/write enable signal I/O to/from stream interface 2 Note	-	Ţ	FLD
SYNC2	37	1/0	Frame sync signal I/O to/from stream interface 2. Note	H/L	Ţ	_
TSSUB2	38	0	Not used. Leave open.	-	0	_

Note When this signal is switched for transmission or reception to/from IEEE1394, it must be controlled that output does not conflict.

To prevent a floating state, connect a pull-up or pull-down resistor to this pin.

(2) Video interface pins

Pin Name	Pin No.	I/O	Function	Active	After	Alternate
					Reset	Function
VCLKI	50	I	Video clock input (27 MHz)	2.—2	-	-
VCLKO	51	0	Video clock output (27 MHz)	-	-	_
VD[7:0]	47 to 40	1/0	Video data signal	7.1—7	ı	STREAM2[7:0]
VSYNC	33	1/0	Vertical sync video signal ^{Note}	L	-	PACKETEN2
HSYNC	34	1/0	Horizontal sync video signal Note	L	-	TSERROR2
FLD	36	1/0	Field index signal Note	\blacksquare		TSRW2
VPWM	53	0	PWM signal for video PLL			_

Note When this signal is switched for transmission or reception to/from IEEE1394, it must be controlled that output does not conflict.

(3) Audio interface pins

Pin Name	Pin No.	I/O	Function	Active	After	Alternate
					Reset	Function
AMCLK48	104	I	Audio master clock input (for 48 kHz sampling frequency)	-	-	1
AMCLK44	103	Ï	Audio master clock input (for 44.1 kHz sampling	_	_	=
			frequency)			
AMCLKO	101	0	Audio master clock output	_	J	=
PCM1	96	1/0	Audio PCM serial data ^{Note}	=	-	=
			With 2 channels: CH1			
			With 4 channels: CH1 or CH1 and CH2 mixed			
PCM2	97	1/0	Audio PCM serial data ^{Note}	_	_	_
			With 2 channels: Mute			
			With 4 channels: CH2			
AEMP1	98	0	PCM1 emphasis ON/OFF for PCM1 output	Н	_	_
AEMP2	100	0	PCM2 emphasis ON/OFF for PCM2 output	Н	-	_
ALRCK	93	1/0	Audio LR clock Note	-	-	=
			L-ch: High			
			R-ch: Low			
ABCK	94	1/0	Audio bit clock ^{Note}	_		
AFS[1:2]	48, 49	0	Audio sampling frequency	-	-	-
			AFS2 AFS1			
			44.1 kHz 0 1			
			48 kHz 0 0			
			32 kHz 1 0			
APWM	102	0	PWM signal for audio PLL	7-1	ı	1

Note The input changes according to the switching of the encode/decode mode. It must be controlled so that the output does not conflict when the mode is switched.

To prevent a floating state, connect a pull-up or pull-down resistor to this pin.

(4) SDRAM interface pins

Pin Name	Pin No.	1/0	Function	Active	After	Alternate
					Reset	Function
MCLK	77	0	CLK pin connection for SDRAM	1—	-	П
MRAS	76	0	RAS pin connection for SDRAM	_	-	_
MCAS	75	0	CAS pin connection for SDRAM	1-0	-	1
MWE	74	0	WE pin connection for SDRAM	-	_	1
MA[11:0]	92,	0	Address pin connection for SDRAM	-	-	
5540	90 to 83,		7			
	81 to 79					
MD[15:0]	73 to 69,	1/0	Data pin connection for SDRAM	-	_	-
	66 to 64,		These pins must be pulled up or down and then must be			
	62 to 57,		directly connected to the SDRAM pins.			
	55, 54					

(5) Host interface pins

(a) Parallel interface pins

Pin Name	Pin No.	1/0	Function	Active	After	Alternate
FIII Name	FIII NO.	1/0	Function	Active		
					Reset	Function
CS	117	Ĩ	Parallel interface chip select input	L	Ĩ	_
RWZ	119	Ī	Parallel interface read/write control input	Ĺ	Ī	=
			ISA bus, SH-1 bus : Write strobe			
			68000 bus : Read/write select signal			
IOR	120	Ĭ	Parallel interface IO read control input	Ĺ	Ĭ	_
			ISA bus, SH-1 bus : Read strobe			
			68000 bus : Data strobe (DS)			
IOCHRDY	123	0	Parallel interface ready output	Ĺ.	0	-
AD[10:1]	116 to 107	Ī	Parallel interface address input	-	Ī	=
P_D[15:0]	143 to 141,	1/0	Parallel interface data input/output	-	Ī	=
	139 to 132,					
	130 to 128,					
	126, 125					
DMAREQ	122	0	DMA request output	L	0	SIO_CNTO
DMAACK	121	Ī	DMA acknowledge input for parallel interface	L	Ī	SIO_CNTI

DVDR70 & DVDR75/0x1

(b) Serial interface pins

Pin Name	Pin No.	1/0	Function	Active	After Reset	Alternate Function
so	145	0	Serial transmit data output for clocked serial interface (CSI)	-	0	P40
SI	146	I	Serial receive data input for clocked serial interface (CSI)	-	I,	P41
SCK	147	0	Clock output for clocked serial interface (CSI)	-	0	P42
TXD	149	0	Serial transmit data output for asynchronous serial interface (UART)	_	0	P43
RXD	150	Ľ	Serial transmit data input for asynchronous serial interface (UART)	1	Ľ	P44
scs	151	0	Chip select output for clocked serial interface (CSI)	_	0	P45
SIO_CNTI	121	ľ.	Control input for asynchronous serial interface (UART) Externally input data is loaded in synchronization with the end of RXD of UART.	J	Î	DMAACK
SIO_CNTO	122	0	Control output for asynchronous serial interface (UART)	COMPANIENT STATE AND		DMAREQ

(c) Others

Pin Name	Pin No.	1/0	Function	Active	After	Alternate
					Reset	Function
INT	124	0	Interrupt output to external device	Н	0	1
PSSEL[1:0]	106, 105	1	Parallel/serial interface selection.	1	Ĺ	_
			These signals select a parallel or serial interface as the			
			external interface.			
			PSSEL[1:0] Selected interface			
			00 Serial interface (UART)			
			01 Parallel interface (ISA bus)			
			10 Parallel interface (68000 bus)			
			11 Parallel interface (SH-1 bus)			

(6) Port pins

Pin Name	Pin No.	1/0	Function		After	Alternate
					Reset	Function
P30	204	1/0	Port 3.	I	I	-
P31	152		This is a 4-bit I/O port that can be set in the input or output			_
P32	153	1	mode in 1-bit units.			_
P33	154		P30 : Connect this pin to GND via a resistor.			_
P34	155		P32: This pin outputs an interrupt to the external device to read the DV status. It cannot be used as a port pin when DV is used.			-
P40	145	1/0	Port 4.	Ţ	Ī	so
P41	146]	This is a 6-bit I/O port that can be set in the input or output			SI
P42	147	1	mode in 1-bit units.			SCK
P43	149	1	P40 to P45 are multiplexed with the pins described under			TXD
P44	150	1	the heading Alternate Function (they cannot be used as			RXD
P45	151		general-purpose port pins).			scs

(7) External ROM connection pins

Pin Name	Pin No.	1/0	Function	Active	After Reset	Alternate Function
D[15:0]	196, 194 to 189, 186 to 178	I/O	xternal ROM data bus xternal ROM data bus used to access external ROM		I	-
A[17:1]	175, 174, 172, 171, 169 to 167, 165 to 156	0	External ROM address bus External ROM address bus used to access external ROM. A space of 256 KB can be addressed.	-	0	-
RDZ	176	0	ROM read This is a strobe signal that indicates a read cycle to the external ROM. It is inactive in the idle state.	L	0	1
WRZ	177	0	ROM write This is a strobe signal that indicates a write cycle to the external ROM.	Ĺ.	0	П

(8) Clock and reset pins

Pin Name	Pin No.	1/0	Function	Active	After	Alternate
					Reset	Function
RESETB	1	ı	Reset. RESETB is asynchronous input. If a signal with a specified low-level width is input to this pin independently of the operating clock, a system reset is effected, taking precedence over all the other operations. This signal can also be used to clear the power-saving mode (HALT or software STOP), as well as for normal initialization and starting. Caution RESETB is active-low.	L	I	1
HS_CLK	202	Ī	Host clock. This pin inputs the clock that is to be supplied to the CPU core and internal peripheral I/O. This clock is input to the internal clock generator. An internal clock is generated according to the value of HCLKSEL and is supplied to the CPU core and internal peripheral I/O. Usually, input a clock of 27 MHz to this pin.	-	Ļ	-
HCLKSEL	197	1	Host clock selection. This pin inputs the clock that is to be supplied to the CPU core and internal peripheral I/O. The relationship between the clock supplied by the HS_CLK pin (27 MHz) and the clock supplied to the CPU core and internal peripheral I/O is as follows: HCLKSEL Internal clock frequency PLL operation 0 54 MHz Multiplied by 2 1 Clock stops. PLL operation stops.	н	ı	-

(9) Power supply, ground, and others

Pin Name	Pin No.	I/O Function		Active	After	Alternate
					Reset	Function
3.3V _{DD}	5, 31, 52, 63, 78, 95, 127, 140, 166, 187	Ī	3.3 V power supply. Supplies a positive voltage of 3.3 V to the I/O pins of the 3.3 V interface.	ì	ï	I
2.5V _{DD}	14, 67, 118, 170	-	2.5 V power supply. Supplies a positive voltage of 2.5 V to the respective internal blocks.	I	1	I
2.5GND 3.3GND	39, 91, 144, 195 9, 35, 56, 68, 82, 99, 131, 148, 173, 188	_	Ground. These are ground pins. Connect all GND pins to a common ground.))	-
PLLAV _{DD}	199	-	Analog power supply to multiplication circuit. Supplies a positive analog voltage to the PLL. Supply 2.5 V to this pin.	ı	-	-
PLLAGND	200	-	Analog ground for multiplication circuit. Analog ground pin for PLL.	-	-	-
PLLDVob	198	-	Digital power supply to multiplication circuit. Supplies a positive digital voltage to the PLL. Supply 2.5 V to this pin.	-	-	-
PLLDGND	201	-	Digital ground for multiplication circuit. – Digital ground pin for PLL.		-	1
IC(L)	203, 205 to 207	-	rectly connect these pins to ground.		-	-
IFIROME	208	ı	Internal ROM/external ROM select input 0: External ROM mode 1: Internal ROM mode	Ī	I	П

1.2 Connection of Unused Pins

The following table shows how to connect unused pins.

Table 1-1. Connection of Unused Pins (1/2)

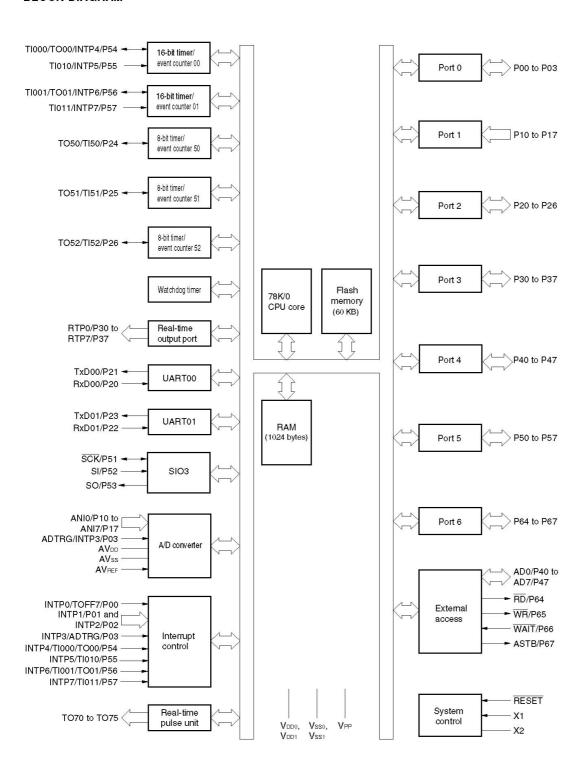

Pin Name	I/O	Interface	Recommended Connection of Unused Pin
PHY_D[7:0]	I/O	I/O Buffer (LVTTL) in 9 mA	Connect these pins to VDD or GND via a
CTL[1:0]		With Bus Holder	resistor.
SCLK	1	I/O Buffer (LVTTL) with bus holder	
LREQ	0	3-state Output Buffer (LVTTL) 9 mA	Leave open
LPS	0	Output Buffer (LVTTL) 9 mA	
LINKON	1	Input Buffer (LVTTL)	Connect these pins to V _{DD} or GND via a
STREAM1[7:0]	1/0	I/O Buffer (LVTTL) 6 mA	resistor.
PACKETEN1			
TSERROR1			
TSRW1			
SYNC1			
STREAM2[7:0]			
PACKETEN2	1		
TSERROR2	1		
TSRW2			
SYNC2	1		
TSSUB1	1		
TSSUB2	0	Output Buffer (LVTTL) 6 mA	Leave open
P3[4:0]	1/0	I/O Buffer (LVTTL) Schmitt in 6 mA	Connect these pins to V _{DD} or GND via a
P40/SO	1	96.5	resistor.
P41/SI			
P42/SCK	1		
P43/TXD	1		
P44/RXD	1		
P45/SCS			
A[17:1]	0	I/O Buffer (LVTTL) 6 mA	
RDZ	0	Output Buffer (LVTTL) 6 mA	Leave open
WRZ			-
D[15:0]	1/0	I/O Buffer (LVTTL) 6 mA	Connect these pins to V _{DD} or GND via a
AD[10:1]	Ш	Input Buffer (LVTTL)	resistor.

3. PIN FUNCTIONS

3.1 Port Pins

Pin Name	I/O	Function	After Reset	Alternate Function
P00	I/O	Port 0	Input	INTP0/TOFF7
P01		4-bit I/O port	-	INTP1
P02		Input/output can be specified in 1-bit units.		INTP2
P03		Use of an on-chip pull-up resistor can be specified by software setting.		INTP3/ADTRG
P10 to P17	Input	Port 1	Input	ANI0 to ANI7
		8-bit input only port		
P20	I/O	Port 2	Input	RxD00
P21		7-bit I/O port		TxD00
P22		Input/output can be specified in 1-bit units.		RxD01
P23		Use of an on-chip pull-up resistor can be specified by		TxD01
P24		software setting.		TI50/TO50
P25				TI51/TO51
P26				TI52/TO52
P30 to P37	I/O	Port 3	Input	RTP0 to RTP7
		8-bit I/O port		
	Input/output can be specified in 1-bit units.			
		Use of an on-chip pull-up resistor can be specified by		
		software setting.		
P40 to P47	I/O	Port 4	Input	AD0 to AD7
		8-bit I/O port		
		Input/output can be specified in 1-bit units.		
		Use of an on-chip pull-up resistor can be specified by		
		software setting.		
P50	I/O	Port 5	Input	_
P51		8-bit I/O port		SCK
P52		Input/output can be specified in 1-bit units.		SI
P53		LEDs can be driven directly.		SO
P54		Use of an on-chip pull-up resistor can be specified by		INTP4/TI000/TO00
P55		software setting.		INTP5/TI010
P56				INTP6/TI001/TO01
P57	1			INTP7/TI011
P64	I/O	Port 6	Input	RD
P65		4-bit I/O port		WR
P66	1	Input/output can be specified in 1-bit units.		WAIT
P67		Use of an on-chip pull-up resistor can be specified by		ASTB
		software setting.		

3.2 Non-Port Pins (1/2)

Pin Name	I/O	Function	After Reset	Alternate Function
INTP0	Input	External interrupt request input for which the valid edge	Input	P00/TOFF7
INTP1		(rising edge, falling edge, or both rising and falling	Input	P01
INTP2		edges) can be specified	Input	P02
INTP3			Input	P03/ADTRG
INTP4			Input	P54/TI000/TO00
INTP5			Input	P55/TI010
INTP6			Input	P56/TI001/TO01
INTP7			Input	P57/TI011
TI50	Input	External count clock input to 8-bit timer/event counter 50	Input	P24/TO50
TI51		External count clock input to 8-bit timer/event counter 51	Input	P25/TO51
TI52		External count clock input to 8-bit timer/event counter 52	Input	P26/TO52
T1000		External count clock input to 16-bit timer/event counter 00	Input	P54/INTP4/TO00
		Capture trigger input to capture register (CR000, CR010) of		
		16-bit timer/event counter 00		
TI010		Capture trigger input to capture register (CR000) of 16-bit	Input	P55/INTP5
		timer/event counter 00	8)	
TI001		External count clock input to 16-bit timer/event counter 01	Input	P56/INTP6/TO01
		Capture trigger input to capture register (CR001, CR011) of		
		16-bit timer/event counter 01		
TI011		Capture trigger input to capture register (CR001) of 16-bit	Input	P57/INTP7
		timer/event counter 01	Victor Andrees	- 1. Immediately
TO50	Output	8-bit timer/event counter 50 output	Input	P24/TI50
TO51	The second secon	8-bit timer/event counter 51 output	Input	P25/TI51
TO52		8-bit timer/event counter 52 output	Input	P26/TI52
TO00		16-bit timer/event counter 00 output	Input	P54/INTP4/TI000
TO01		16-bit timer/event counter 01 output	Input	P56/INTP6/TI001
RTP0 to RTP7	Output	Real-time output port that outputs pulses in synchronization	Input	P30 to P37
	1.	with trigger signals outputs from the real-time pulse unit		
TxD00	Output	Asynchronous serial interface serial data output	Input	P21
TxD01		Control Control (Control Control Contr	Input	P23
RxD00	Input	Asynchronous serial interface serial data input	Input	P20
RxD01			Input	P22
SCK	1/0	Serial interface serial clock input/output	Input	P51
SI	Input	Serial interface serial data input	Input	P52
so	Output	Serial interface serial data output	Input	P53
ANI0 to ANI7		A/D converter analog input	Input	P10 to P17
ADTRG	Input	External trigger signal input to the A/D converter	Input	P03/INTP3
TO70 to TO75	Output	Timer output for the 3-phase PWM inverter control	Hi-Z	_
TOFF7	Input	Timer output (TO70 to TO75) stop external input	Input	P00/INTP0
AD0 to AD7	1/0	Address/data bus for expanding memory externally	Input	P40 to P47
RD	Output	Strobe signal output for reading from external memory	Input	P64
WR	2 3.40 510	Strobe signal output for writing to external memory	Input	P65
WAIT	Input	Wait insertion at external memory access	Input	P66
ASTB	Output	Strobe output that externally latches address information	Input	P67
,	Japar	output to ports 4 and 5 to access external memory	input	
AVREF	Input	A/D converter reference voltage input	_	_
AVDD	- ф	A/D converter analog power supply		_

3.2 Non-Port Pins (2/2)

Pin Name	1/0	Function	After Reset	Alternate Function
AVss	_	A/D converter ground potential	-	-
RESET	Input	System reset input	-	e -
X1	Input	Connecting crystal resonator for system clock oscillation	-	-
X2	_		-	-
V _{DD0}	_	Positive power supply for ports	12 - 2	<u>-</u>
Vsso	_	Ground potential for ports	-	_
V _{DD1}	_	Positive power supply except for ports	-	-
Vssi	-	Ground potential except for ports	-	: -
VPP	-	High-voltage application during program write/verify. In the normal operation mode, connect directly to Vsso.	-	_

3.3 Pin I/O Circuits and Recommended Connection of Unused Pins

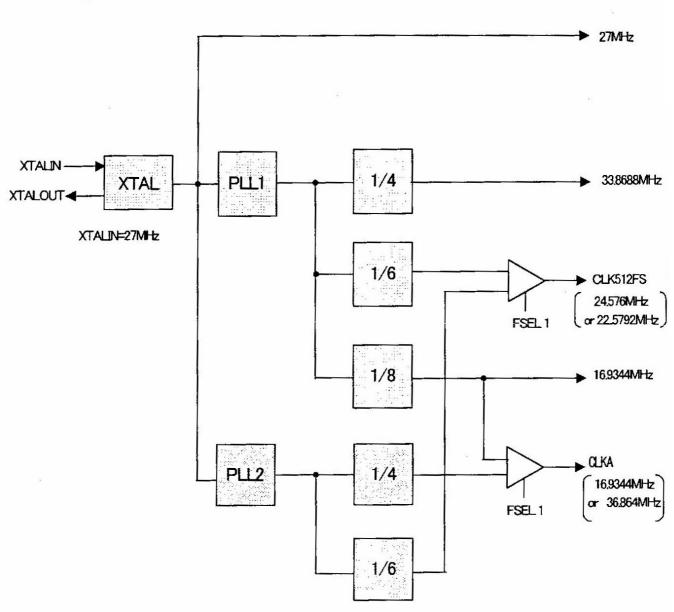

The I/O circuit type of each pin and recommended connection of unused pins are shown in Table 3-1. For the I/O circuit configuration of each type, refer to Figure 3-1.

Table 3-1. Types of Pin I/O Circuits

Pin Name	I/O Circuit Type	I/O	Recommended Connection of Unused Pins
P00/INTP0/TOFF7	8-C	I/O	Input: Independently connect to V _{SS0} via a resistor.
P01/INTP1			Output: Leave open
P02/INTP2			
P03/INTP3/ADTRG			
P10/ANI0 to P17/ANI7	25	Input	Independently connect to VDD0 or VSS0 via a resistor.
P20/RxD00	8-C	I/O	Input: Independently connect to VDD0 or Vsso via a
P21/TxD00	5-H		resistor.
P22/RxD01	8-C		Output: Leave open.
P23/TxD01	5-H		
P24/TI50/TO50	8-C		
P25/TI51/TO51			
P26/TI52/TO52			
P30/RTP0 to P37/RTP7	5-H		
P40/AD0 to P47/AD7			
P50			
P51/SCK	8-C		
P52/SI	5-H		
P53/SO			
P54/INTP4/TI000/TO00			
P55/INTP5/TI010			
P56/INTP6/TI001/TO01			
P57/INTP7/TI011			
P64/RD			
P65/WR			
P66/WAIT			
P67/ASTB			
TO70 to TO75	4	Output	Leave open.
RESET	2	Input	-
AVDD	_	_	Connect to VDDO.
AVREF			Connect to Vsso.
AVss			
V _{PP}			Connect directly to Vsso.

IC7605: BU2288FV, DVIO Board, Clock Divider

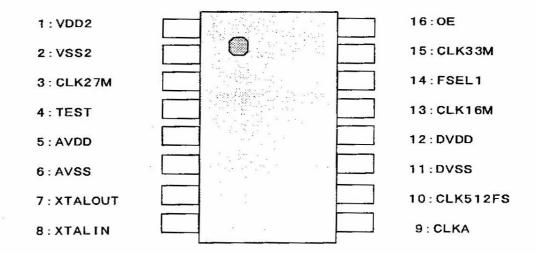

FSEL1	OLK512FS	CLKA
OPEN	22. 5792MH	16, 9344MHz
L	24. 576MHz	36.864MHz

Explanation for terminal function

PIN No.	PIN NAME	FUNCTION
1	V002	Digital VDD for 27MHz clock cutput
2	VSS2	Digital GND for 27MHz clock output
3	CUK27N	27MHz clock output
4	TEST	Output for test
5	AVDD	Analog VOD
6	AVSS	Analog GND
7	XTALOUT	Standard crystal output
8	XTALIN	Standard crystal input
9	OLKA .	clock output (FSEL1=Open: 16. 9344MHz, FSEL1=L: 36. 864MHz)
10	OLK512FS	clock output (FSEL1=Open: 22 5792MHz, FSEL1=L: 24. 576MHz)
11	DVSS	Digital GND
12	DVDD	Digital VDD
13	OLK16M	16. 9344MHz clock output
14	FSEL1	Output select :with pull-up
¥		Open: 16. 9344MHz (9pin), 22. 5792MHz (10pin)
		L :36. 864MHz (9pin), 24. 576MHz (10pin)
15	CLK33M	33. 8688MHz clock output
16	OE	Output enable (open:enable, Lidisable) :with pull-up

IC7604: BA7082F, DVIO Board, PLL IC

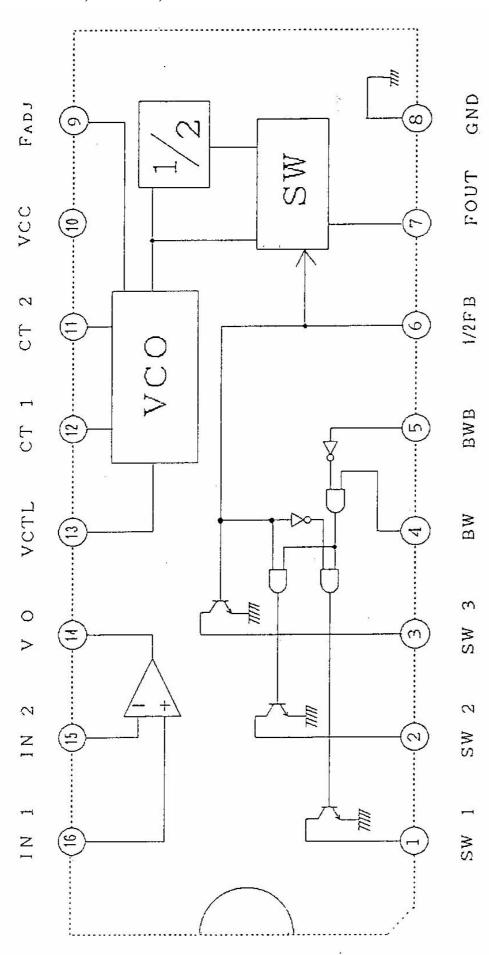

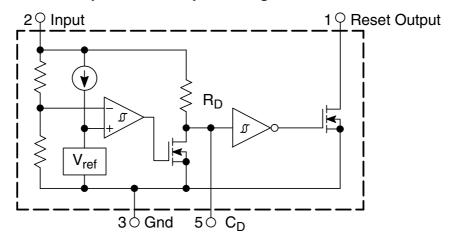

Fig-2 Block diagram

No.	Symbol	IN	OUT	normal Voltag	Internal pin configuration	Description
10	vcc	_	_	5.0V	vcc	vcc
11	СТ2	e	_	1.9V	1.2	Pin 11,12 are added capasitor pins for oscillation. Use to added capacitor between CT1 and CT2.
12	CT1				150 %	If value of capacitor down, oscillation frequency up.
13	VCTL	0		2.5V	10 K N 20 K 10 K N 20 K 16.2 K N 16.2 K N 1	Pin13 is control pin for VCO. A regular this pin connect pin14(VO).
14	VO		0	2.5V	350 u A	Pin14 is output pin at Amlplfier for sencitivity ajdustment. Adjustment amplifier GAIN by added resistor.
15	IN2	0		2.5V	103	Pin15,16 are input pins at amplifier for sencitivity adjustment. In1; normal input In2; inversion input
16	IN1)		2.04	103 20uA	In , myoroton mpat

IC7501 NCP1570D, Digital Board 2.1 Chrysalis, DC/DC Converter Control

NCP1570

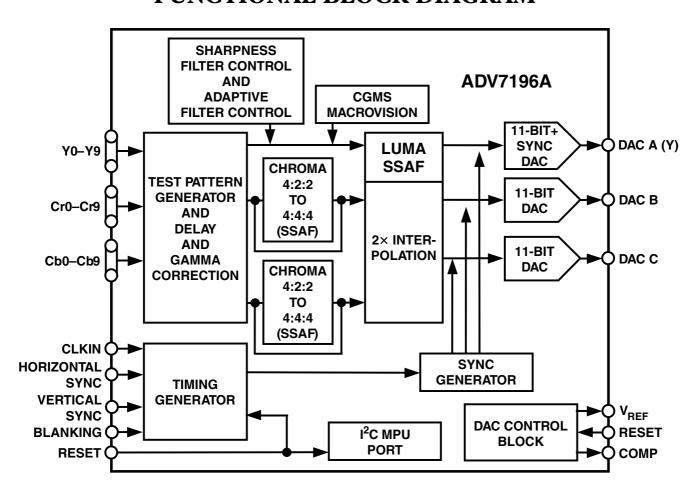

PACKAGE PIN DESCRIPTION

PACKAGE PIN #		
SO-8	PIN SYMBOL	FUNCTION
1	V _{CC}	Power supply input.
2	PWRGD	Open collector output goes low when V _{FB} is out of regulation. User must externally limit current into this pin to less than 20 mA.
3	PGDELAY	External capacitor programs PWRGD low-to-high transition delay.
4	COMP	Error amp output. PWM comparator reference input. A capacitor to LGND provides error amp compensation and Soft Start. Pulling pin < 0.45 locks gate outputs to a zero percent duty cycle state.
5	GATE(H)	High-side switch FET driver pin. Capable of delivering peak currents of 1.5 A.
6	GATE(L)	Low-side synchronous FET driver pin. Capable of delivering peak currents of 1.5 A.
7	V _{FB}	Error amplifier and PWM comparator input.
8	GND	Power supply return.

IC7703 ADV7196A, Digital Board 2.1 Chrysalis, Progressive Scan Video Encoder

FUNCTIONAL BLOCK DIAGRAM

ADV7196A

PIN FUNCTION DESCRIPTIONS

Pin	Mnemonic	Input/Output	Function
1, 12	V_{DD}	P	Digital Power Supply
2-11	Y0–Y9	I	10-Bit Progressive Scan/HDTV Input Port for Y Data. Input for G data when RGB data is input.
13, 52	GND	G	Digital Ground
14–23	Cr0-Cr9	I	10-Bit Progressive Scan/HDTV Input Port for Color Data in 4:4:4 Input Mode. In 4:2:2 mode this input port is not used. Input port for R data when RGB data is input.
24, 35	V_{AA}	P	Analog Power Supply
25	CLKIN	I	Pixel Clock Input. Requires a 27 MHz reference clock for standard operation in Progressive Scan Mode or a 74.25 MHz (74.1758 MHz) reference clock in HDTV mode.
26, 33	AGND	G	Analog Ground
27 28	DV VSYNC/ TSYNC	I I	Video Blanking Control Signal Input VSYNC, Vertical Sync Control Signal Input or TSYNC Input Control Signal in Async Timing Mode
29	HSYNC/ SYNC	I	HSYNC, Horizontal Sync Control Signal Input or SYNC Input Control Signal in Async Timing Mode
30	SCL	I	MPU Port Serial Interface Clock Input
31	SDA	I/O	MPU Port Serial Data Input/Output
32	DAC C	0	Color Component Analog Output of Input Data on Cb/Cr9-0 Input Pins
34	DAC A	0	Y Analog Output
36	DAC B	0	Color Component Analog Output of Input Data on Cr9-Cr0 Input Pins
37	COMP	0	Compensation Pin for DACs. Connect 0.1 µF capacitor from COMP pin to V _{AA} .
38	R _{SET}	I	A 2470 Ω resistor (for input ranges 64–940 and 64–960; output standards EIA-770.1–EIA-770.3) must be connected from this pin to ground and is used to control the amplitudes of the DAC outputs. For input ranges 0–1023 (output standards RS-170, RS-343A) the R _{SET} value must be 2820 Ω .
39	V_{REF}	I/O	Optional External Voltage Reference Input for DACs or Voltage Reference Output (1.235 V)
40	RESET	I	This input resets the on-chip timing generator and sets the ADV7196A into Default Register setting. Reset is an active low signal.
41	ALSB	I	TTL Address Input. This signal sets up the LSB of the MPU address. When this pin is tied high, the I ² C filter is activated which reduces noise on the I ² C interface. When this pin is tied low, the input bandwidth on the I ² C interface is increased.
42–51	Cb/Cr9-0	I	10-Bit Progressive Scan/HDTV Input Port for Color Data. In 4:2:2 mode the multiplexed CrCb data must be input on these pins. Input port for B data when RGB is input.

9.13 List of Abbreviations

Analog Board

+5VSTBY	Permanent Supply 5V
	. Pin8 Scart2 (only for Europe)
	. Data from Analog- to Digital-Board
A_DATA	(UART-Communication)
A DDV	,
A_RD1	. Analog-board ready (status
A40 A40	information to digital-board)
A18 - A19	. Parallel Address Bus (CC - Flash-
	ROM and S-RAM)
A8 - A17	. Parallel Address Bus (CC - Flash-
	ROM and S-RAM)
AD0 - AD7	. Parallel Address and Data Bus (CC -
	Flash-ROM and S-RAM)
AFC	. Automatic Frequency Control
AFEL	. Audio Frontend Left
AFER	. Audio Frontend Right
AGC / WSRI	. Automatic Gain Control (for Europe),
	Wide Screen Rear In (for NTSC)
AINFL	` ,
AINFR	Audio In Front Right
AKILL	
ALADC	
ALDAC	
ALE	
∧∟∟	. Addiess Lateri Liidble

AM0	Adress-mode 0
AM1	Adress-mode 1
ARADC	Audio Right to ADC
ARDAC	Audio Right from DAC
ASCC1M	Audio Scart 1 Mute (System Clock
	Output for Real time Clock-
	Adjustment)
AVCC	Power Supply for A/D-converter
	GND-Pin for A/D-converter
CFIN	Chroma Front In
CS0	Chip Select 0 (CC - S-RAM)
CS2	Chip Select 2 (CC - Flash-ROM)
CVBSFIN	Video Front In
D_DATA	Data from Digital- to Analog-Board
	(UART-Communication)
D_RDY	Digital-board ready (status information
	from digital-board)
DAC_MUTE	
DAOUT	
DVAL	Audio from Digital Video In Left
DVAR	Audio from Digital Video In Right
DVCC1	Power Supply Pin
DVCC2	Power Supply Pin
DVCC3	Power Supply Pin
DVSS1	GND Pin
DVSS2	GND Pin
DVSS3	
FAN_OFF	Fan for Basic engine
